CHAPTER 1

Core Functions

```
int wally_init (uint32_t flags)
```

Initialize wally.

This function must be called once before threads are created by the application.

Parameters

- **flags** – Flags controlling what to initialize. Currently must be zero.

Returns

See [Error Codes](#)

```
int wally_cleanup (uint32_t flags)
```

Free any internally allocated memory.

Parameters

- **flags** – Flags controlling what to clean up. Currently must be zero.

Returns

See [Error Codes](#)

```
struct secp256k1_context_struct *wally_get_secp_context (void)
```

Fetch the wally internal secp256k1 context object.

By default, a single global context is created on demand. This behaviour can be overriden by providing a custom context fetching function when calling [wally_set_operations](#).

```
struct secp256k1_context_struct *wally_get_new_secp_context (void)
```

Create a new wally-suitable secp256k1 context object.

The created context is initialised to be usable by all wally functions.

```
void wally_secp_context_free (struct secp256k1_context_struct *ctx)
```

Free a secp256k1 context object created by [wally_get_new_secp_context](#).

This function must only be called on context objects returned from [wally_get_new_secp_context](#), it should not be called on the default context returned from [wally_get_secp_context](#).

```
int wally_bzero (void *bytes, size_t bytes_len)
```

Securely wipe memory.

Parameters

- **bytes** – Memory to wipe
- **bytes_len** – Size of bytes in bytes.

Returns See [Error Codes](#)

int **wally_free_string** (char *str)

Securely wipe and then free a string allocated by the library.

Parameters

- **str** – String to free (must be NUL terminated UTF-8).

Returns See [Error Codes](#)

int **wally_secp_randomize** (const unsigned char *bytes, size_t bytes_len)

Provide entropy to randomize the libraries internal libsecp256k1 context.

Random data is used in libsecp256k1 to blind the data being processed, making side channel attacks more difficult. By default, Wally uses a single internal context for secp functions that is not initially randomized.

The caller should call this function before using any functions that rely on libsecp256k1 (i.e. Anything using public/private keys). If the caller has overriden the library's default libsecp context fetching using *wally_set_operations*, then it may be necessary to call this function before calling wally functions in each thread created by the caller.

If wally is used in its default configuration, this function should either be called before threads are created or access to wally functions wrapped in an application level mutex.

Parameters

- **bytes** – Entropy to use.
- **bytes_len** – Size of bytes in bytes. Must be WALLY_SECP_RANDOMIZE_LEN.

Returns See [Error Codes](#)

int **wally_hex_verify** (const char *hex)

Verify that a hexadecimal string is valid.

Parameters

- **hex** – String to verify.

Returns See [Error Codes](#)

int **wally_hex_n_verify** (const char *hex, size_t hex_len)

Verify that a known-length hexadecimal string is valid.

See [wally_hex_verify](#).

Returns See [Error Codes](#)

int **wally_hex_from_bytes** (const unsigned char *bytes, size_t bytes_len, char **output)

Convert bytes to a (lower-case) hexadecimal string.

Parameters

- **bytes** – Bytes to convert.
- **bytes_len** – Size of bytes in bytes.
- **output** – Destination for the resulting hexadecimal string. The string returned should be freed using [wally_free_string](#).

Returns See [Error Codes](#)

```
int wally_hex_to_bytes (const char *hex, unsigned char *bytes_out, size_t len, size_t *written)
```

Convert a hexadecimal string to bytes.

Parameters

- **hex** – String to convert.
- **bytes_out** – Where to store the resulting bytes.
- **len** – The length of `bytes_out` in bytes.
- **written** – Destination for the number of bytes written to `bytes_out`.

Returns

See [Variable Length Output Buffers](#)

```
int wally_hex_n_to_bytes (const char *hex, size_t hex_len, unsigned char *bytes_out, size_t len,
```

`size_t *written)`

Convert a known-length hexadecimal string to bytes.

See [wally_hex_to_bytes](#).

Returns

See [Variable Length Output Buffers](#)

```
int wally_base58_from_bytes (const unsigned char *bytes, size_t bytes_len, uint32_t flags, char **output)
```

Create a base 58 encoded string representing binary data.

Parameters

- **bytes** – Binary data to convert.
- **bytes_len** – The length of `bytes` in bytes.
- **flags** – Pass `BASE58_FLAG_CHECKSUM` if `bytes` should have a checksum calculated and appended before converting to base 58.
- **output** – Destination for the base 58 encoded string representing `bytes`. The string returned should be freed using [wally_free_string](#).

Returns

See [Error Codes](#)

```
int wally_base58_to_bytes (const char *str_in, uint32_t flags, unsigned char *bytes_out, size_t len,
```

`size_t *written)`

Decode a base 58 encoded string back into binary data.

Parameters

- **str_in** – Base 58 encoded string to decode.
- **flags** – Pass `BASE58_FLAG_CHECKSUM` if `bytes_out` should have a checksum validated and removed before returning. In this case, `len` must contain an extra `BASE58_CHECKSUM_LEN` bytes to calculate the checksum into. The returned length will not include the checksum.
- **bytes_out** – Destination for converted binary data.
- **len** – The length of `bytes_out` in bytes.
- **written** – Destination for the length of the decoded bytes.

Returns

See [Variable Length Output Buffers](#)

```
int wally_base58_n_to_bytes (const char *str_in, size_t str_len, uint32_t flags, unsigned
```

`char *bytes_out, size_t len, size_t *written)`

Decode a known-length base 58 encoded string back into binary data.

See [wally_base58_to_bytes](#).

Returns See *Variable Length Output Buffers*

```
int wally_base58_get_length(const char *str_in, size_t *written)
```

Return the length of a base 58 encoded string once decoded into bytes.

Returns the exact number of bytes that would be required to store `str_in` as decoded binary, including any embedded checksum. If the string contains invalid characters then `WALLY_EINVAL` is returned. Note that no checksum validation takes place.

In the worst case (an all zero buffer, represented by a string of ‘1’ characters), this function will return `strlen(str_in)`. You can therefore safely use the length of `str_in` as a buffer size to avoid calling this function in most cases.

Parameters

- **str_in** – Base 58 encoded string to find the length of.
- **written** – Destination for the length of the decoded bytes.

Returns See *Error Codes*

```
int wally_base58_n_get_length(const char *str_in, size_t str_len, size_t *written)
```

Return the length of a known-length base 58 encoded string once decoded into bytes.

See [wally_base58_get_length](#).

Returns See *Error Codes*

```
int wally_base64_from_bytes(const unsigned char *bytes, size_t bytes_len, uint32_t flags, char **output)
```

Create a base64 encoded string representing binary data.

Parameters

- **bytes** – Binary data to convert.
- **bytes_len** – The length of `bytes` in bytes.
- **flags** – Must be 0.
- **output** – Destination for the base64 encoded string representing `bytes`. The string returned should be freed using [wally_free_string](#).

Returns See *Error Codes*

```
int wally_base64_to_bytes(const char *str_in, uint32_t flags, unsigned char *bytes_out, size_t len, size_t *written)
```

Decode a base64 encoded string back into binary data.

Parameters

- **str_in** – Base64 encoded string to decode.
- **flags** – Must be 0.
- **bytes_out** – Destination for converted binary data.
- **len** – The length of `bytes_out` in bytes. See [wally_base64_get_maximum_length](#).
- **written** – Destination for the length of the decoded bytes.

Returns See *Variable Length Output Buffers*

```
int wally_base64_get_maximum_length(const char *str_in, uint32_t flags, size_t *written)
```

Return the maximum length of a base64 encoded string once decoded into bytes.

Since base64 strings may contain line breaks and padding, it is not possible to compute their decoded length without fully decoding them. This function cheaply calculates the maximum possible decoded length, which can be used to allocate a buffer for `wally_base64_to_bytes`. In most cases the decoded data will be shorter than the value returned.

Parameters

- **str_in** – Base64 encoded string to find the length of.
- **flags** – Must be 0.
- **written** – Destination for the maximum length of the decoded bytes.

Returns See [Error Codes](#)

```
int wally_get_operations (struct wally_operations *output)
```

Fetch the current overridable operations used by wally.

Parameters

- **output** – Destination for the overridable operations.

Returns See [Error Codes](#)

```
int wally_set_operations (const struct wally_operations *ops)
```

Set the current overridable operations used by wally.

Parameters

- **ops** – The overridable operations to set.

Note: Any NULL members in the passed structure are ignored.

Returns See [Error Codes](#)

```
int wally_is_elements_build (size_t *written)
```

Determine if the library was built with elements support.

Parameters

- **written** – 1 if the library supports elements, otherwise 0.

Returns See [Error Codes](#)

CHAPTER 2

Crypto Functions

```
int wally_scrypt (const unsigned char *pass, size_t pass_len, const unsigned char *salt, size_t salt_len,
                  uint32_t cost, uint32_t block_size, uint32_t parallelism, unsigned char *bytes_out,
                  size_t len)
```

Derive a pseudorandom key from inputs using an expensive application of HMAC SHA-256.

Parameters

- **pass** – Password to derive from.
- **pass_len** – Length of pass in bytes.
- **salt** – Salt to derive from.
- **salt_len** – Length of salt in bytes.
- **cost** – The cost of the function. The larger this number, the longer the key will take to derive.
- **block_size** – The size of memory blocks required.
- **parallelism** – Parallelism factor.
- **bytes_out** – Destination for the derived pseudorandom key.
- **len** – The length of **bytes_out** in bytes.

Returns

See [Error Codes](#)

```
int wally_aes (const unsigned char *key, size_t key_len, const unsigned char *bytes, size_t bytes_len,
               uint32_t flags, unsigned char *bytes_out, size_t len)
```

Encrypt/decrypt data using AES (ECB mode, no padding).

Parameters

- **key** – Key material for initialisation.
- **key_len** – Length of **key** in bytes. Must be an **AES_KEY_LEN** constant.
- **bytes** – Bytes to encrypt/decrypt.
- **bytes_len** – Length of **bytes** in bytes. Must be a multiple of **AES_BLOCK_LEN**.

- **flags** – **AES_FLAG_** constants indicating the desired behavior.
- **bytes_out** – Destination for the encrypted/decrypted data.
- **len** – The length of **bytes_out** in bytes. Must be a multiple of AES_BLOCK_LEN.

Returns See [Error Codes](#)

```
int wally_aes_cbc(const unsigned char *key, size_t key_len, const unsigned char *iv, size_t iv_len,
                   const unsigned char *bytes, size_t bytes_len, uint32_t flags, unsigned char *bytes_out,
                   size_t len, size_t *written)
```

Encrypt/decrypt data using AES (CBC mode, PKCS#7 padding).

Parameters

- **key** – Key material for initialisation.
- **key_len** – Length of **key** in bytes. Must be an **AES_KEY_LEN_** constant.
- **iv** – Initialisation vector.
- **iv_len** – Length of **iv** in bytes. Must be AES_BLOCK_LEN.
- **bytes** – Bytes to encrypt/decrypt.
- **bytes_len** – Length of **bytes** in bytes. Must be a multiple of AES_BLOCK_LEN.
- **flags** – **AES_FLAG_** constants indicating the desired behavior.
- **bytes_out** – Destination for the encrypted/decrypted data.
- **len** – The length of **bytes_out** in bytes. Must be a multiple of AES_BLOCK_LEN.
- **written** – Destination for the number of bytes written to **bytes_out**.

Returns See [Variable Length Output Buffers](#)

```
int wally_sha256(const unsigned char *bytes, size_t bytes_len, unsigned char *bytes_out, size_t len)
```

SHA-256(m)

Parameters

- **bytes** – The message to hash.
- **bytes_len** – The length of **bytes** in bytes.
- **bytes_out** – Destination for the resulting hash.
- **len** – The length of **bytes_out** in bytes. Must be SHA256_LEN.

Returns See [Error Codes](#)

```
int wally_sha256_midstate(const unsigned char *bytes, size_t bytes_len, unsigned char *bytes_out,
                           size_t len)
```

SHA-256(m) midstate

Parameters

- **bytes** – The message to hash.
- **bytes_len** – The length of **bytes** in bytes.
- **bytes_out** – Destination for the resulting hash.
- **len** – The length of **bytes_out** in bytes. Must be SHA256_LEN.

Returns See [Error Codes](#)

```
int wally_sha256d(const unsigned char *bytes, size_t bytes_len, unsigned char *bytes_out, size_t len)
```

SHA-256(SHA-256(m)) (double SHA-256).

Parameters

- **bytes** – The message to hash.
- **bytes_len** – The length of **bytes** in bytes.
- **bytes_out** – Destination for the resulting hash.
- **len** – The length of **bytes_out** in bytes. Must be SHA256_LEN.

Returns

 See [Error Codes](#)

```
int wally_sha512 (const unsigned char *bytes, size_t bytes_len, unsigned char *bytes_out, size_t len)
SHA-512(m).
```

Parameters

- **bytes** – The message to hash.
- **bytes_len** – The length of **bytes** in bytes.
- **bytes_out** – Destination for the resulting hash.
- **len** – The length of **bytes_out** in bytes. Must be SHA512_LEN.

Returns

 See [Error Codes](#)

```
int wally_ripemd160 (const unsigned char *bytes, size_t bytes_len, unsigned char *bytes_out, size_t len)
RIPEMD-160(m).
```

Parameters

- **bytes** – The message to hash.
- **bytes_len** – The length of **bytes** in bytes.
- **bytes_out** – Destination for the resulting hash.
- **len** – The length of **bytes_out** in bytes. Must be RIPEMD160_LEN.

Returns

 See [Error Codes](#)

```
int wally_hash160 (const unsigned char *bytes, size_t bytes_len, unsigned char *bytes_out, size_t len)
RIPEMD-160(SHA-256(m)).
```

Parameters

- **bytes** – The message to hash.
- **bytes_len** – The length of **bytes** in bytes.
- **bytes_out** – Destination for the resulting hash.
- **len** – The length of **bytes_out** in bytes. Must be HASH160_LEN.

Returns

 See [Error Codes](#)

```
int wally_hmac_sha256 (const unsigned char *key, size_t key_len, const unsigned char *bytes,
size_t bytes_len, unsigned char *bytes_out, size_t len)
Compute an HMAC using SHA-256.
```

Parameters

- **key** – The key for the hash.
- **key_len** – The length of **key** in bytes.
- **bytes** – The message to hash.
- **bytes_len** – The length of **bytes** in bytes.

- **bytes_out** – Destination for the resulting HMAC.
- **len** – The length of bytes_out in bytes. Must be HMAC_SHA256_LEN.

Returns See [Error Codes](#)

```
int wally_hmac_sha512(const unsigned char *key, size_t key_len, const unsigned char *bytes,
                      size_t bytes_len, unsigned char *bytes_out, size_t len)
```

Compute an HMAC using SHA-512.

Parameters

- **key** – The key for the hash.
- **key_len** – The length of key in bytes.
- **bytes** – The message to hash.
- **bytes_len** – The length of bytes in bytes.
- **bytes_out** – Destination for the resulting HMAC.
- **len** – The length of bytes_out in bytes. Must be HMAC_SHA512_LEN.

Returns See [Error Codes](#)

```
int wally_pbkdf2_hmac_sha256(const unsigned char *pass, size_t pass_len, const unsigned char *salt,
                             size_t salt_len, uint32_t flags, uint32_t cost, unsigned char *bytes_out,
                             size_t len)
```

Derive a pseudorandom key from inputs using HMAC SHA-256.

Parameters

- **pass** – Password to derive from.
- **pass_len** – Length of pass in bytes.
- **salt** – Salt to derive from.
- **salt_len** – Length of salt in bytes.
- **flags** – Reserved, must be 0.
- **cost** – The cost of the function. The larger this number, the longer the key will take to derive.
- **bytes_out** – Destination for the derived pseudorandom key.
- **len** – The length of bytes_out in bytes. This must be a multiple of PBKDF2_HMAC_SHA256_LEN.

Returns See [Error Codes](#)

```
int wally_pbkdf2_hmac_sha512(const unsigned char *pass, size_t pass_len, const unsigned char *salt,
                             size_t salt_len, uint32_t flags, uint32_t cost, unsigned char *bytes_out,
                             size_t len)
```

Derive a pseudorandom key from inputs using HMAC SHA-512.

Parameters

- **pass** – Password to derive from.
- **pass_len** – Length of pass in bytes.
- **salt** – Salt to derive from.
- **salt_len** – Length of salt in bytes.
- **flags** – Reserved, must be 0.

- **cost** – The cost of the function. The larger this number, the longer the key will take to derive.
- **bytes_out** – Destination for the derived pseudorandom key.
- **len** – The length of bytes_out in bytes. This must be a multiple of PBKDF2_HMAC_SHA512_LEN.

Returns See [Error Codes](#)

```
int wally_ec_private_key_verify(const unsigned char *priv_key, size_t priv_key_len)
```

Verify that a private key is valid.

Parameters

- **priv_key** – The private key to validate.
- **priv_key_len** – The length of priv_key in bytes. Must be EC_PRIVATE_KEY_LEN.

Returns See [Error Codes](#)

```
int wally_ec_public_key_verify(const unsigned char *pub_key, size_t pub_key_len)
```

Verify that a public key is valid.

Parameters

- **pub_key** – The public key to validate.
- **pub_key_len** – The length of pub_key in bytes. Must be EC_PUBLIC_KEY_LEN or EC_PUBLIC_KEY_UNCOMPRESSED_LEN.

Returns See [Error Codes](#)

```
int wally_ec_xonly_public_key_verify(const unsigned char *pub_key, size_t pub_key_len)
```

Verify that an x-only public key is valid.

Parameters

- **pub_key** – The x-only public key to validate.
- **pub_key_len** – The length of pub_key in bytes. Must be EC_XONLY_PUBLIC_KEY_LEN.

Returns See [Error Codes](#)

```
int wally_ec_public_key_from_private_key(const unsigned char *priv_key, size_t priv_key_len,
```

```
                                         unsigned char *bytes_out, size_t len)
```

Create a public key from a private key.

Parameters

- **priv_key** – The private key to create a public key from.
- **priv_key_len** – The length of priv_key in bytes. Must be EC_PRIVATE_KEY_LEN.
- **bytes_out** – Destination for the resulting public key.
- **len** – The length of bytes_out in bytes. Must be EC_PUBLIC_KEY_LEN.

Returns See [Error Codes](#)

```
int wally_ec_public_key_decompress(const unsigned char *pub_key, size_t pub_key_len, unsigned
```

```
                                    char *bytes_out, size_t len)
```

Create an uncompressed public key from a compressed public key.

Parameters

- **pub_key** – The public key to decompress.
- **pub_key_len** – The length of pub_key in bytes. Must be EC_PUBLIC_KEY_LEN.
- **bytes_out** – Destination for the resulting public key.
- **len** – The length of bytes_out in bytes. Must be EC_PUBLIC_KEY_UNCOMPRESSED_LEN.

Returns See [Error Codes](#)

```
int wally_ec_public_key_negate(const unsigned char *pub_key, size_t pub_key_len, unsigned char *bytes_out, size_t len)
```

Negates a public key.

Parameters

- **pub_key** – The public key to negate.
- **pub_key_len** – The length of pub_key in bytes. Must be EC_PUBLIC_KEY_LEN.
- **bytes_out** – Destination for the resulting public key.
- **len** – The length of bytes_out in bytes. Must be EC_PUBLIC_KEY_LEN.

Returns See [Error Codes](#)

```
int wally_ec_sig_from_bytes(const unsigned char *priv_key, size_t priv_key_len, const unsigned char *bytes, size_t bytes_len, uint32_t flags, unsigned char *bytes_out, size_t len)
```

Sign a message hash with a private key, producing a compact signature.

Parameters

- **priv_key** – The private key to sign with.
- **priv_key_len** – The length of priv_key in bytes. Must be EC_PRIVATE_KEY_LEN.
- **bytes** – The message hash to sign.
- **bytes_len** – The length of bytes in bytes. Must be EC_MESSAGE_HASH_LEN.
- **flags** – **EC_FLAG_** flag values indicating desired behavior.
- **bytes_out** – Destination for the resulting compact signature.
- **len** – The length of bytes_out in bytes. Must be EC_SIGNATURE_LEN if EC_FLAG_RECOVERABLE is not set, otherwise must be EC_SIGNATURE_RECOVERABLE_LEN.

Returns See [Error Codes](#)

```
int wally_ec_sig_normalize(const unsigned char *sig, size_t sig_len, unsigned char *bytes_out, size_t len)
```

Convert a signature to low-s form.

Parameters

- **sig** – The compact signature to convert.
- **sig_len** – The length of sig in bytes. Must be EC_SIGNATURE_LEN.
- **bytes_out** – Destination for the resulting low-s signature.
- **len** – The length of bytes_out in bytes. Must be EC_SIGNATURE_LEN.

Returns See [Error Codes](#)

```
int wally_ec_sig_to_der(const unsigned char *sig, size_t sig_len, unsigned char *bytes_out, size_t len,
                        size_t *written)
```

Convert a compact signature to DER encoding.

Parameters

- **sig** – The compact signature to convert.
- **sig_len** – The length of **sig** in bytes. Must be EC_SIGNATURE_LEN.
- **bytes_out** – Destination for the resulting DER encoded signature.
- **len** – The length of **bytes_out** in bytes. Must be EC_SIGNATURE_DER_MAX_LEN.
- **written** – Destination for the number of bytes written to **bytes_out**.

Returns

See [Variable Length Output Buffers](#)

```
int wally_ec_sig_from_der(const unsigned char *bytes, size_t bytes_len, unsigned char *bytes_out,
                           size_t len)
```

Convert a DER encoded signature to a compact signature.

Parameters

- **bytes** – The DER encoded signature to convert.
- **bytes_len** – The length of **sig** in bytes.
- **bytes_out** – Destination for the resulting compact signature.
- **len** – The length of **bytes_out** in bytes. Must be EC_SIGNATURE_LEN.

Returns

See [Error Codes](#)

```
int wally_ec_sig_verify(const unsigned char *pub_key, size_t pub_key_len, const unsigned char *bytes,
                        size_t bytes_len, uint32_t flags, const unsigned char *sig, size_t sig_len)
```

Verify a signed message hash.

Parameters

- **pub_key** – The public key to verify with.
- **pub_key_len** – The length of **pub_key** in bytes. Must be EC_PUBLIC_KEY_LEN.
- **bytes** – The message hash to verify.
- **bytes_len** – The length of **bytes** in bytes. Must be EC_MESSAGE_HASH_LEN.
- **flags** – **EC_FLAG** flag values indicating desired behavior.
- **sig** – The compact signature of the message in **bytes**.
- **sig_len** – The length of **sig** in bytes. Must be EC_SIGNATURE_LEN.

Returns

See [Error Codes](#)

```
int wally_ec_sig_to_public_key(const unsigned char *bytes, size_t bytes_len, const unsigned
                               char *sig, size_t sig_len, unsigned char *bytes_out, size_t len)
```

Recover compressed public key from a recoverable signature.

Parameters

- **bytes** – The message hash signed.
- **bytes_len** – The length of **bytes** in bytes. Must be EC_MESSAGE_HASH_LEN.
- **sig** – The recoverable compact signature of the message in **bytes**.
- **sig_len** – The length of **sig** in bytes. Must be EC_SIGNATURE_RECOVERABLE_LEN.

- **bytes_out** – Destination for recovered public key.
- **len** – The length of bytes_out in bytes. Must be EC_PUBLIC_KEY_LEN.

Note: The successful recovery of the public key guarantees the correctness of the signature.

Returns See *Error Codes*

```
int wally_ec_scalar_verify(const unsigned char *scalar, size_t scalar_len)
```

Verify that a secp256k1 scalar value is valid.

Parameters

- **scalar** – The starting scalar to have a value added to.
- **scalar_len** – The length of scalar in bytes. Must be EC_SCALAR_LEN.

Returns See *Error Codes*

```
int wally_ec_scalar_add(const unsigned char *scalar, size_t scalar_len, const unsigned char *operand,
```

```
size_t operand_len, unsigned char *bytes_out, size_t len)
```

Add one secp256k1 scalar to another.

Parameters

- **scalar** – The starting scalar to have a value added to.
- **scalar_len** – The length of scalar in bytes. Must be EC_SCALAR_LEN.
- **operand** – The scalar value to add to scalar.
- **operand_len** – The length of operand in bytes. Must be EC_SCALAR_LEN.
- **bytes_out** – Destination for the resulting scalar.
- **len** – The length of bytes_out in bytes. Must be EC_SCALAR_LEN.

Note: Computes (scalar + operand) % n. Returns WALLY_ERROR if either input is not within the secp256k1 group order n.

Returns See *Error Codes*

```
int wally_ec_scalar_subtract(const unsigned char *scalar, size_t scalar_len, const unsigned char *operand,
```

```
size_t operand_len, unsigned char *bytes_out,
```

```
size_t len)
```

Subtract one secp256k1 scalar from another.

Parameters

- **scalar** – The starting scalar to have a value subtracted from.
- **scalar_len** – The length of scalar in bytes. Must be EC_SCALAR_LEN.
- **operand** – The scalar value to subtract from scalar.
- **operand_len** – The length of operand in bytes. Must be EC_SCALAR_LEN.
- **bytes_out** – Destination for the resulting scalar.
- **len** – The length of bytes_out in bytes. Must be EC_SCALAR_LEN.

Note: Computes $(\text{scalar} - \text{operand}) \% n$. Returns WALLY_ERROR if either input is not within the secp256k1 group order n.

Returns See *Error Codes*

```
int wally_ec_scalar_multiply(const unsigned char *scalar, size_t scalar_len, const unsigned
                             char *operand, size_t operand_len, unsigned char *bytes_out,
                             size_t len)
```

Multiply one secp256k1 scalar by another.

Parameters

- **scalar** – The starting scalar to multiply.
- **scalar_len** – The length of `scalar` in bytes. Must be EC_SCALAR_LEN.
- **operand** – The scalar value to multiply `scalar` by.
- **operand_len** – The length of `operand` in bytes. Must be EC_SCALAR_LEN.
- **bytes_out** – Destination for the resulting scalar.
- **len** – The length of `bytes_out` in bytes. Must be EC_SCALAR_LEN.

Note: Computes $(\text{scalar} * \text{operand}) \% n$. Returns WALLY_ERROR if either input is not within the secp256k1 group order n.

Returns See *Error Codes*

```
int wally_ec_scalar_add_to(unsigned char *scalar, size_t scalar_len, const unsigned char *operand,
                           size_t operand_len)
```

Add one secp256k1 scalar to another in place.

Note: As per `wally_ec_scalar_add` with `scalar` modified in place.

Returns See *Error Codes*

```
int wally_ec_scalar_subtract_from(unsigned char *scalar, size_t scalar_len, const unsigned
                                   char *operand, size_t operand_len)
```

Subtract one secp256k1 scalar from another in place.

Note: As per `wally_ec_scalar_subtract` with `scalar` modified in place.

Returns See *Error Codes*

```
int wally_ec_scalar_multiply_by(unsigned char *scalar, size_t scalar_len, const unsigned
                               char *operand, size_t operand_len)
```

Multiply one secp256k1 scalar by another in place.

Note: As per `wally_ec_scalar_multiply` with `scalar` modified in place.

Returns See *Error Codes*

```
int wally_format_bitcoin_message (const unsigned char *bytes, size_t bytes_len, uint32_t flags, un-
signed char *bytes_out, size_t len, size_t *written)
```

Format a message for use as a bitcoin signed message.

Parameters

- **bytes** – The message string to sign.
- **bytes_len** – The length of bytes in bytes. Must be less than or equal to BITCOIN_MESSAGE_MAX_LEN.
- **flags** – **BITCOIN_MESSAGE_FLAG_** flags indicating the desired output. if BITCOIN_MESSAGE_FLAG_HASH is passed, the double SHA256 hash of the message is placed in bytes_out instead of the formatted message. In this case len must be at least SHA256_LEN.
- **bytes_out** – Destination for the formatted message or message hash.
- **len** – The length of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out.

Returns See *Variable Length Output Buffers*

```
int wally_ecdh (const unsigned char *pub_key, size_t pub_key_len, const unsigned char *priv_key,
size_t priv_key_len, unsigned char *bytes_out, size_t len)
```

Compute an EC Diffie-Hellman secret in constant time.

Parameters

- **pub_key** – The public key.
- **pub_key_len** – The length of pub_key in bytes. Must be EC_PUBLIC_KEY_LEN.
- **priv_key** – The private key.
- **priv_key_len** – The length of priv_key in bytes. Must be EC_PRIVATE_KEY_LEN.
- **bytes_out** – Destination for the shared secret.
- **len** – The length of bytes_out in bytes. Must be SHA256_LEN.

Note: If priv_key is invalid, this call returns WALLY_ERROR.

Returns See *Error Codes*

```
int wally_s2c_sig_from_bytes (const unsigned char *priv_key, size_t priv_key_len, const un-
signed char *bytes, size_t bytes_len, const unsigned char *s2c_data,
size_t s2c_data_len, uint32_t flags, unsigned char *s2c_opening_out,
size_t s2c_opening_out_len, unsigned char *bytes_out, size_t len)
```

Sign a message hash with a private key, producing a compact signature which commits to additional data using sign-to-contract (s2c).

Parameters

- **priv_key** – The private key to sign with.
- **priv_key_len** – The length of priv_key in bytes. Must be EC_PRIVATE_KEY_LEN.

- **bytes** – The message hash to sign.
- **bytes_len** – The length of bytes in bytes. Must be EC_MESSAGE_HASH_LEN.
- **s2c_data** – The data to commit to.
- **s2c_data_len** – The length of s2c_data in bytes. Must be WALLY_S2C_DATA_LEN.
- **flags** – Must be EC_FLAG_ECDSA.
- **s2c_opening_out** – Destination for the resulting opening information.
- **s2c_opening_out_len** – The length of s2c_opening_out in bytes. Must be WALLY_S2C_OPENING_LEN.
- **bytes_out** – Destination for the resulting compact signature.
- **len** – The length of bytes_out in bytes. Must be EC_SIGNATURE_LEN.

Returns See [Error Codes](#)

```
int wally_s2c_commitment_verify(const unsigned char *sig, size_t sig_len, const unsigned
                                char *s2c_data, size_t s2c_data_len, const unsigned
                                char *s2c_opening, size_t s2c_opening_len, uint32_t flags)
```

Verify a sign-to-contract (s2c) commitment.

Parameters

- **sig** – The compact signature.
- **sig_len** – The length of sig in bytes. Must be EC_SIGNATURE_LEN.
- **s2c_data** – The data that was committed to.
- **s2c_data_len** – The length of s2c_data in bytes. Must be WALLY_S2C_DATA_LEN.
- **s2c_opening** – The opening information produced during signing.
- **s2c_opening_len** – The length of s2c_opening in bytes. Must be WALLY_S2C_OPENING_LEN.
- **flags** – Must be EC_FLAG_ECDSA.

Returns See [Error Codes](#)

CHAPTER 3

Address Functions

```
int wally_addr_segwit_from_bytes(const unsigned char *bytes, size_t bytes_len, const  
                                 char *addr_family, uint32_t flags, char **output)
```

Create a segwit native address from a v0 or later witness program.

Parameters

- **bytes** – Witness program bytes, including the version and data push opcode.
- **bytes_len** – Length of bytes in bytes. Must be HASH160_LEN or SHA256_LEN for v0 witness programs.
- **addr_family** – Address family to generate, e.g. “bc” or “tb”.
- **flags** – For future use. Must be 0.
- **output** – Destination for the resulting segwit native address string.

Returns See *Error Codes*

```
int wally_addr_segwit_to_bytes(const char *addr, const char *addr_family, uint32_t flags, unsigned  
                               char *bytes_out, size_t len, size_t *written)
```

Get a scriptPubKey containing the witness program from a segwit native address.

Parameters

- **addr** – Address to fetch the witness program from.
- **addr_family** – Address family to generate, e.g. “bc” or “tb”.
- **flags** – For future use. Must be 0.
- **bytes_out** – Destination for the resulting scriptPubKey (including the version and data push opcode)
- **len** – Length of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out.

Returns See *Variable Length Output Buffers*

```
int wally_addr_segwit_n_to_bytes (const char *addr, size_t addr_len, const char *addr_family,
                                  size_t addr_family_len, uint32_t flags, unsigned char *bytes_out,
                                  size_t len, size_t *written)
```

Get a scriptPubKey containing the witness program from a known-length segwit native address.

See [wally_addr_segwit_to_bytes](#).

Returns See [Variable Length Output Buffers](#)

```
int wally_addr_segwit_get_version (const char *addr, const char *addr_family, uint32_t flags,
                                    size_t *written)
```

Get the segwit version of a segwit native address.

Parameters

- **addr** – Address to fetch the witness program from.
- **addr_family** – Address family to generate, e.g. “bc” or “tb”.
- **flags** – For future use. Must be 0.
- **written** – Destination for the segwit version from 0 to 16 inclusive.

Returns See [Error Codes](#)

```
int wally_addr_segwit_n_get_version (const char *addr, size_t addr_len, const char *addr_family,
                                      size_t addr_family_len, uint32_t flags, size_t *written)
```

Get the segwit version of a known-length segwit native address.

See [wally_addr_segwit_get_version](#).

Returns See [Error Codes](#)

```
int wally_address_to_scriptpubkey (const char *addr, uint32_t network, unsigned char *bytes_out,
                                    size_t len, size_t *written)
```

Infer a scriptPubKey from an address.

Parameters

- **addr** – Base58 encoded address to infer the scriptPubKey from. For confidential Liquid addresses first call [wally_confidential_addr_to_addr\(\)](#)
- **network** – One of WALLY_NETWORK_BITCOIN_MAINNET, WALLY_NETWORK_BITCOIN_TESTNET, WALLY_NETWORK_LIQUID_REGTEST.
- **bytes_out** – Destination for the resulting scriptPubKey
- **len** – Length of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out.

Returns See [Variable Length Output Buffers](#)

```
int wally_scriptpubkey_to_address (const unsigned char *scriptpubkey, size_t scriptpubkey_len,
                                    uint32_t network, char **output)
```

Infer address from a scriptPubKey. For SegWit addresses, use [wally_addr_segwit_from_bytes](#) instead. To find out if an address is SegWit, use [wally_scriptpubkey_get_type](#).

Parameters

- **scriptpubkey** – scriptPubKey bytes.
- **scriptpubkey_len** – Length of scriptpubkey in bytes.

- **network** – One of WALLY_NETWORK_BITCOIN_MAINNET, WALLY_NETWORK_BITCOIN_TESTNET, WALLY_NETWORK_LIQUID, WALLY_NETWORK_REGTEST.
- **output** – Destination for the resulting Base58 encoded address string.

Returns See *Error Codes*

```
int wally_wif_from_bytes(const unsigned char *priv_key, size_t priv_key_len, uint32_t prefix,
                        uint32_t flags, char **output)
```

Convert a private key to Wallet Import Format.

Parameters

- **priv_key** – Private key bytes.
- **priv_key_len** – The length of `priv_key` in bytes. Must be `EC_PRIVATE_KEY_LEN`.
- **prefix** – Expected prefix byte, e.g. `WALLY_ADDRESS_VERSION_WIF_MAINNET` or `WALLY_ADDRESS_VERSION_WIF_TESTNET`.
- **flags** – Pass `WALLY_WIF_FLAG_COMPRESSED` if the corresponding pubkey is compressed, otherwise `WALLY_WIF_FLAG_UNCOMPRESSED`.
- **output** – Destination for the resulting Wallet Import Format string.

Returns See *Error Codes*

```
int wally_wif_to_bytes(const char *wif, uint32_t prefix, uint32_t flags, unsigned char *bytes_out,
                       size_t len)
```

Convert a Wallet Import Format string to a private key.

Parameters

- **wif** – Private key in Wallet Import Format.
- **prefix** – Prefix byte to use, e.g. `WALLY_ADDRESS_VERSION_WIF_MAINNET` or `WALLY_ADDRESS_VERSION_WIF_TESTNET`.
- **flags** – Pass `WALLY_WIF_FLAG_COMPRESSED` if the corresponding pubkey is compressed, otherwise `WALLY_WIF_FLAG_UNCOMPRESSED`.
- **bytes_out** – Destination for the private key.
- **len** – The length of `bytes_out` in bytes. Must be `EC_PRIVATE_KEY_LEN`.

Returns See *Error Codes*

```
int wally_wif_is_uncompressed(const char *wif, size_t *written)
```

Determine if a private key in Wallet Import Format corresponds to an uncompressed public key.

Parameters

- **wif** – Private key in Wallet Import Format to check.
- **written** – 1 if the corresponding public key is uncompressed, 0 if compressed.

Returns See *Error Codes*

```
int wally_wif_to_public_key(const char *wif, uint32_t prefix, unsigned char *bytes_out, size_t len,
                           size_t *written)
```

Create a public key corresponding to a private key in Wallet Import Format.

Parameters

- **wif** – Private key in Wallet Import Format.

- **prefix** – Prefix byte to use, e.g. 0x80, 0xef.
- **bytes_out** – Destination for the resulting public key.
- **len** – The length of **bytes_out**.
- **written** – Destination for the number of bytes written to **bytes_out**.

Returns See [Variable Length Output Buffers](#)

```
int wally_bip32_key_to_address(const struct ext_key *hdkey, uint32_t flags, uint32_t version,
                               char **output)
```

Create a legacy or wrapped SegWit address corresponding to a BIP32 key.

Parameters

- **hdkey** – The extended key to use.
- **flags** – WALLY_ADDRESS_TYPE_P2PKH for a legacy address, WALLY_ADDRESS_TYPE_P2SH_P2WPKH for P2SH-wrapped SegWit.
- **version** – Version byte to generate address, e.g. with Bitcoin: WALLY_ADDRESS_VERSION_P2PKH_MAINNET, WALLY_ADDRESS_VERSION_P2PKH_TESTNET, WALLY_ADDRESS_VERSION_P2SH_MAINNET and WALLY_ADDRESS_VERSION_P2SH_TESTNET.
- **output** – Destination for the resulting address string.

Returns See [Error Codes](#)

```
int wally_bip32_key_to_addr_segwit(const struct ext_key *hdkey, const char *addr_family,
                                    uint32_t flags, char **output)
```

Create a native SegWit address corresponding to a BIP32 key.

Parameters

- **hdkey** – The extended key to use.
- **addr_family** – Address family to generate, e.g. “bc” or “tb”.
- **flags** – For future use. Must be 0.
- **output** – Destination for the resulting segwit native address string.

Returns See [Error Codes](#)

```
int wally_wif_to_address(const char *wif, uint32_t prefix, uint32_t version, char **output)
```

Create a P2PKH address corresponding to a private key in Wallet Import Format.

Parameters

- **wif** – Private key in Wallet Import Format.
- **prefix** – Prefix byte to use, e.g. 0x80, 0xef.
- **version** – Version byte to generate address, e.g. WALLY_ADDRESS_VERSION_P2PKH_MAINNET, WALLY_ADDRESS_VERSION_P2PKH_TESTNET.
- **output** – Destination for the resulting address string.

Returns See [Error Codes](#)

```
int wally_confidential_addr_to_addr(const char *address, uint32_t prefix, char **output)
```

Extract the address from a confidential address.

Parameters

- **address** – The base58 encoded confidential address to extract the address from.

- **prefix** – The confidential address prefix byte, e.g. WALLY_CA_PREFIX_liquid.
- **output** – Destination for the resulting address string.

Returns See [Error Codes](#)

```
int wally_confidential_addr_to_ec_public_key(const char *address, uint32_t prefix, unsigned  
                                              char *bytes_out, size_t len)
```

Extract the blinding public key from a confidential address.

Parameters

- **address** – The base58 encoded confidential address to extract the public key from.
- **prefix** – The confidential address prefix byte, e.g. WALLY_CA_PREFIX_liquid.
- **bytes_out** – Destination for the public key.
- **len** – The length of bytes_out in bytes. Must be EC_PUBLIC_KEY_LEN.

Returns See [Error Codes](#)

```
int wally_confidential_addr_from_addr(const char *address, uint32_t prefix, const unsigned  
                                              char *pub_key, size_t pub_key_len, char **output)
```

Create a confidential address from an address and blinding public key.

Parameters

- **address** – The base58 encoded address to make confidential.
- **prefix** – The confidential address prefix byte, e.g. WALLY_CA_PREFIX_liquid.
- **pub_key** – The blinding public key to associate with address.
- **pub_key_len** – The length of pub_key in bytes. Must be EC_PUBLIC_KEY_LEN.
- **output** – Destination for the resulting address string.

Returns See [Error Codes](#)

```
int wally_confidential_addr_to_addr_segwit(const char *address, const char *confiden-  
                                             tial_addr_family, const char *addr_family,  
                                             char **output)
```

Extract the segwit native address from a confidential address.

Parameters

- **address** – The blech32 encoded confidential address to extract the address from.
- **confidential_addr_family** – The confidential address family of address.
- **addr_family** – The address family to generate.
- **output** – Destination for the resulting address string. The string returned should be freed using [wally_free_string](#).

Returns See [Error Codes](#)

```
int wally_confidential_addr_segwit_to_ec_public_key(const char *address, const  
                                              char *confidential_addr_family, un-  
                                              signed char *bytes_out, size_t len)
```

Extract the blinding public key from a segwit confidential address.

Parameters

- **address** – The blech32 encoded confidential address to extract the public key from.
- **confidential_addr_family** – The confidential address family of address.

- **bytes_out** – Destination for the public key.
- **len** – The length of bytes_out in bytes. Must be EC_PUBLIC_KEY_LEN.

Returns See *Error Codes*

```
int wally_confidential_addr_from_addr_segwit(const char *address, const char *addr_family,
                                              const char *confidential_addr_family, const
                                              unsigned char *pub_key, size_t pub_key_len,
                                              char **output)
```

Create a confidential address from a segwit native address and blinding public key.

Parameters

- **address** – The bech32 encoded address to make confidential.
- **addr_family** – The address family to generate.
- **confidential_addr_family** – The confidential address family to generate.
- **pub_key** – The blinding public key to associate with address.
- **pub_key_len** – The length of pub_key in bytes. Must be EC_PUBLIC_KEY_LEN.
- **output** – Destination for the resulting address string. The string returned should be freed using *wally_free_string*.

Returns See *Error Codes*

CHAPTER 4

Bip32 Functions

```
int bip32_key_free (const struct ext_key *hdkey)
    Free a key allocated by bip32_key_from_seed_alloc, bip32_key_from_seed_custom or
    bip32_key_unserialize_alloc.
```

Parameters

- **hdkey** – Key to free.

Returns

See [Error Codes](#)

```
int bip32_key_init (uint32_t version, uint32_t depth, uint32_t child_num, const unsigned
                    char *chain_code, size_t chain_code_len, const unsigned char *pub_key,
                    size_t pub_key_len, const unsigned char *priv_key, size_t priv_key_len, const
                    unsigned char *hash160, size_t hash160_len, const unsigned char *parent160,
                    size_t parent160_len, struct ext_key *output)
```

Initialize a key.

Returns

See [Error Codes](#)

```
int bip32_key_init_alloc (uint32_t version, uint32_t depth, uint32_t child_num, const unsigned
                           char *chain_code, size_t chain_code_len, const unsigned char *pub_key,
                           size_t pub_key_len, const unsigned char *priv_key, size_t priv_key_len, const
                           unsigned char *hash160, size_t hash160_len, const unsigned char *parent160,
                           size_t parent160_len, struct ext_key **output)
```

As per [bip32_key_init](#), but allocates the key.

Returns

See [Error Codes](#)

```
int bip32_key_from_seed_custom (const unsigned char *bytes, size_t bytes_len, uint32_t version, const
                                 unsigned char *hmac_key, size_t hmac_key_len, uint32_t flags,
                                 struct ext_key *output)
```

Create a new master extended key from entropy.

This creates a new master key, i.e. the root of a new HD tree. The entropy passed in may produce an invalid key. If this happens, WALLY_ERROR will be returned and the caller should retry with new entropy.

Parameters

- **bytes** – Entropy to use.
- **bytes_len** – Size of bytes in bytes. Must be one of BIP32_ENTROPY_LEN_128, BIP32_ENTROPY_LEN_256 or BIP32_ENTROPY_LEN_512.
- **version** – Either BIP32_VER_MAIN_PRIVATE or BIP32_VER_TEST_PRIVATE, indicating mainnet or testnet/regtest respectively.
- **hmac_key** – Custom data to HMAC-SHA512 with bytes before creating the key. Pass NULL to use the default BIP32 key of “Bitcoin seed”.
- **hmac_key_len** – Size of hmac_key in bytes, or 0 if hmac_key is NULL.
- **flags** – Either BIP32_FLAG_SKIP_HASH to skip hash160 calculation, or 0.
- **output** – Destination for the resulting master extended key.

Returns See [Error Codes](#)

```
int bip32_key_from_seed(const unsigned char *bytes, size_t bytes_len, uint32_t version, uint32_t flags,
                        struct ext_key **output)
```

As per [bip32_key_from_seed_custom](#) With the default BIP32 seed.

Returns See [Error Codes](#)

```
int bip32_key_from_seed_custom_alloc(const unsigned char *bytes, size_t bytes_len,
                                      uint32_t version, const unsigned char *hmac_key,
                                      size_t hmac_key_len, uint32_t flags, struct ext_key **output)
```

As per [bip32_key_from_seed_custom](#), but allocates the key. .. note:: The returned key should be freed with [bip32_key_free](#).

Returns See [Error Codes](#)

```
int bip32_key_from_seed_alloc(const unsigned char *bytes, size_t bytes_len, uint32_t version,
                             uint32_t flags, struct ext_key **output)
```

As per [bip32_key_from_seed](#), but allocates the key. .. note:: The returned key should be freed with [bip32_key_free](#).

Returns See [Error Codes](#)

```
int bip32_key_serialize(const struct ext_key *hdkey, uint32_t flags, unsigned char *bytes_out,
                        size_t len)
```

Serialize an extended key to memory using BIP32 format.

Parameters

- **hdkey** – The extended key to serialize.
- **flags** – BIP32_FLAG_KEY_ Flags indicating which key to serialize. You can not serialize a private extended key from a public extended key.
- **bytes_out** – Destination for the serialized key.
- **len** – Size of bytes_out in bytes. Must be BIP32_SERIALIZED_LEN.

Returns See [Error Codes](#)

```
int bip32_key_unserialize(const unsigned char *bytes, size_t bytes_len, struct ext_key *output)
```

Un-serialize an extended key from memory.

Parameters

- **bytes** – Storage holding the serialized key.
- **bytes_len** – Size of bytes in bytes. Must be BIP32_SERIALIZED_LEN.

- **output** – Destination for the resulting extended key.

Returns See *Error Codes*

```
int bip32_key_unserialize_alloc(const unsigned char *bytes, size_t bytes_len, struct ext_key **output)
```

As per *bip32_key_unserialize*, but allocates the key.

Note: The returned key should be freed with *bip32_key_free*.

Returns See *Error Codes*

```
int bip32_key_from_parent(const struct ext_key *hdkey, uint32_t child_num, uint32_t flags, struct ext_key **output)
```

Create a new child extended key from a parent extended key.

Parameters

- **hdkey** – The parent extended key.
- **child_num** – The child number to create. Numbers greater than or equal to BIP32_INITIAL_HARDENED_CHILD represent hardened keys that cannot be created from public parent extended keys.
- **flags** – BIP32_FLAG_KEY_ Flags indicating the type of derivation wanted. You can not derive a private child extended key from a public parent extended key.
- **output** – Destination for the resulting child extended key.

Returns See *Error Codes*

```
int bip32_key_from_parent_alloc(const struct ext_key *hdkey, uint32_t child_num, uint32_t flags, struct ext_key **output)
```

As per *bip32_key_from_parent*, but allocates the key. .. note:: The returned key should be freed with *bip32_key_free*.

Returns See *Error Codes*

```
int bip32_key_from_parent_path(const struct ext_key *hdkey, const uint32_t *child_path, size_t child_path_len, uint32_t flags, struct ext_key *output)
```

Create a new child extended key from a parent extended key and a path.

Parameters

- **hdkey** – The parent extended key.
- **child_path** – The path of child numbers to create.
- **child_path_len** – The number of child numbers in **child_path**.
- **flags** – BIP32_FLAG_ Flags indicating the type of derivation wanted.
- **output** – Destination for the resulting child extended key.

Returns See *Error Codes*

```
int bip32_key_from_parent_path_alloc(const struct ext_key *hdkey, const uint32_t *child_path, size_t child_path_len, uint32_t flags, struct ext_key **output)
```

As per *bip32_key_from_parent_path*, but allocates the key. .. note:: The returned key should be freed with *bip32_key_free*.

Returns See *Error Codes*

```
int bip32_key_from_parent_path_str(const struct ext_key *hdkey, const char *path_str,
                                   uint32_t child_num, uint32_t flags, struct ext_key *output)
```

Create a new child extended key from a parent extended key and a path string.

Parameters

- **hdkey** – The parent extended key.
- **path_str** – The BIP32 path string of child numbers to create.
- **child_num** – The child number to use if `path_str` contains a * wildcard.
- **flags** – BIP32_FLAG_ Flags indicating the type of derivation wanted.
- **output** – Destination for the resulting child extended key.

Returns See *Error Codes*

```
int bip32_key_from_parent_path_str_n(const struct ext_key *hdkey, const char *path_str,
                                     size_t path_str_len, uint32_t child_num, uint32_t flags,
                                     struct ext_key *output)
```

Create a new child extended key from a parent extended key and a known-length path string.

See [bip32_key_from_parent_path_str](#).

Returns See *Error Codes*

```
int bip32_key_from_parent_path_str_alloc(const struct ext_key *hdkey, const char *path_str,
                                         uint32_t child_num, uint32_t flags, struct
                                         ext_key **output)
```

As per [bip32_key_from_parent_path_str](#), but allocates the key. .. note:: The returned key should be freed with [bip32_key_free](#).

Returns See *Error Codes*

```
int bip32_key_from_parent_path_str_n_alloc(const struct ext_key *hdkey, const char *path_str,
                                           size_t path_str_len, uint32_t child_num,
                                           uint32_t flags, struct ext_key **output)
```

As per [bip32_key_from_parent_path_str_n](#), but allocates the key. .. note:: The returned key should be freed with [bip32_key_free](#).

Returns See *Error Codes*

```
int bip32_key_with_tweak_from_parent_path(const struct ext_key *hdkey, const
                                          uint32_t *child_path, size_t child_path_len,
                                          uint32_t flags, struct ext_key *output)
```

Derive the pub tweak from a parent extended key and a path.

Parameters

- **hdkey** – The parent extended key.
- **child_path** – The path of child numbers to create.
- **child_path_len** – The number of child numbers in `child_path`.
- **bytes_out** – Destination for the resulting pub tweak.
- **len** – Length of `bytes_out` in bytes. Must be EC_PRIVATE_KEY_LEN.

Returns See *Error Codes*

```
int bip32_key_with_tweak_from_parent_path_alloc(const struct ext_key *hdkey,
                                                const uint32_t *child_path,
                                                size_t child_path_len, uint32_t flags,
                                                struct ext_key **output)
```

As per [bip32_key_with_tweak_from_parent_path](#), but allocates the key. ... note:: The returned key should be freed with [bip32_key_free](#).

Returns See [Error Codes](#)

```
int bip32_key_to_base58(const struct ext_key *hdkey, uint32_t flags, char **output)
```

Convert an extended key to base58.

Parameters

- **hdkey** – The extended key.
- **flags** – BIP32_FLAG_KEY_ Flags indicating which key to serialize. You can not serialize a private extended key from a public extended key.
- **output** – Destination for the resulting key in base58. The string returned should be freed using [wally_free_string](#).

Returns See [Error Codes](#)

```
int bip32_key_from_base58(const char *base58, struct ext_key *output)
```

Convert a base58 encoded extended key to an extended key.

Parameters

- **base58** – The extended key in base58.
- **output** – Destination for the resulting extended key.

Returns See [Error Codes](#)

```
int bip32_key_from_base58_n(const char *base58, size_t base58_len, struct ext_key *output)
```

Convert a known-length base58 encoded extended key to an extended key.

See [bip32_key_from_base58](#).

Returns See [Error Codes](#)

```
int bip32_key_from_base58_alloc(const char *base58, struct ext_key **output)
```

As per [bip32_key_from_base58](#), but allocates the key.

Note: The returned key should be freed with [bip32_key_free](#).

Returns See [Error Codes](#)

```
int bip32_key_from_base58_n_alloc(const char *base58, size_t base58_len, struct ext_key **output)
```

As per [bip32_key_from_base58_n](#), but allocates the key.

Note: The returned key should be freed with [bip32_key_free](#).

Returns See [Error Codes](#)

```
int bip32_key_strip_private_key (struct ext_key *hdkey)
```

Converts a private extended key to a public extended key. Afterwards, only public child extended keys can be derived, and only the public serialization can be created. If the provided key is already public, nothing will be done.

Parameters

- **hdkey** – The extended key to convert.

Returns See *Error Codes*

```
int bip32_key_get_fingerprint (struct ext_key *hdkey, unsigned char *bytes_out, size_t len)
```

Get the BIP32 fingerprint for an extended key. Performs hash160 calculation if previously skipped with BIP32_FLAG_SKIP_HASH.

Parameters

- **hdkey** – The extended key.
- **bytes_out** – Destination for the fingerprint.
- **len** – Size of bytes_out in bytes. Must be BIP32_KEY_FINGERPRINT_LEN.

Returns See *Error Codes*

CHAPTER 5

Bip38 Functions

```
int bip38_raw_from_private_key(const unsigned char *bytes, size_t bytes_len, const unsigned char *pass, size_t pass_len, uint32_t flags, unsigned char *bytes_out, size_t len)
```

Encode a private key in raw BIP 38 address format.

Parameters

- **bytes** – Private key to use.
- **bytes_len** – Size of bytes in bytes. Must be EC_PRIVATE_KEY_LEN.
- **pass** – Password for the encoded private key.
- **pass_len** – Length of pass in bytes.
- **flags** – **BIP38_KEY_** flags indicating desired behavior.
- **bytes_out** – Destination for the resulting raw BIP38 address.
- **len** – Size of bytes_out in bytes. Must be BIP38_SERIALIZED_LEN.

Returns See *Error Codes*

```
int bip38_from_private_key(const unsigned char *bytes, size_t bytes_len, const unsigned char *pass, size_t pass_len, uint32_t flags, char **output)
```

Encode a private key in BIP 38 address format.

Parameters

- **bytes** – Private key to use.
- **bytes_len** – Size of bytes in bytes. Must be EC_PRIVATE_KEY_LEN.
- **pass** – Password for the encoded private key.
- **pass_len** – Length of pass in bytes.
- **flags** – **BIP38_KEY_** flags indicating desired behavior.
- **output** – Destination for the resulting BIP38 address.

Returns See *Error Codes*

```
int bip38_raw_to_private_key(const unsigned char *bytes, size_t bytes_len, const unsigned
                             char *pass, size_t pass_len, uint32_t flags, unsigned char *bytes_out,
                             size_t len)
```

Decode a raw BIP 38 address to a private key.

Parameters

- **bytes** – Raw BIP 38 address to decode.
- **bytes_len** – Size of bytes in bytes. Must be BIP38_SERIALIZED_LEN.
- **pass** – Password for the encoded private key.
- **pass_len** – Length of pass in bytes.
- **flags** – **BIP38_KEY_** flags indicating desired behavior.
- **bytes_out** – Destination for the resulting private key.
- **len** – Size of bytes_out in bytes. Must be EC_PRIVATE_KEY_LEN.

Returns See *Error Codes*

```
int bip38_to_private_key(const char *bip38, const unsigned char *pass, size_t pass_len, uint32_t flags,
                        unsigned char *bytes_out, size_t len)
```

Decode a BIP 38 address to a private key.

Parameters

- **bip38** – BIP 38 address to decode.
- **pass** – Password for the encoded private key.
- **pass_len** – Length of pass in bytes.
- **flags** – **BIP38_KEY_** flags indicating desired behavior.
- **bytes_out** – Destination for the resulting private key.
- **len** – Size of bytes_out in bytes. Must be EC_PRIVATE_KEY_LEN.

Returns See *Error Codes*

```
int bip38_raw_get_flags(const unsigned char *bytes, size_t bytes_len, size_t *written)
```

Get compression and/or EC mult flags.

Parameters

- **bytes** – Raw BIP 38 address to get the flags from.
- **bytes_len** – Size of bytes in bytes. Must be BIP38_SERIALIZED_LEN.
- **written** – **BIP38_KEY_** flags indicating behavior.

Returns See *Error Codes*

```
int bip38_get_flags(const char *bip38, size_t *written)
```

Get compression and/or EC mult flags.

Parameters

- **bip38** – BIP 38 address to get the flags from.
- **written** – **BIP38_KEY_** flags indicating behavior.

Returns See *Error Codes*

CHAPTER 6

Bip39 Functions

```
int bip39_get_languages (char **output)
    Get the list of default supported languages.

..note:: The string returned should be freed using wally_free_string.
```

Returns See *Error Codes*

```
int bip39_get_wordlist (const char *lang, struct words **output)
    Get the default word list for a language.
```

Parameters

- **lang** – Language to use. Pass NULL to use the default English list.
- **output** – Destination for the resulting word list.

Note: The returned structure should not be freed or modified.

Returns See *Error Codes*

```
int bip39_get_word (const struct words *w, size_t index, char **output)
    Get the ‘index’th word from a word list.
```

Parameters

- **w** – Word list to use. Pass NULL to use the default English list.
- **index** – The 0-based index of the word in w.
- **output** – Destination for the resulting word.

The string returned should be freed using *wally_free_string*.

Returns See *Error Codes*

```
int bip39_mnemonic_from_bytes (const struct words *w, const unsigned char *bytes, size_t bytes_len,
                               char **output)
```

Generate a mnemonic sentence from the entropy in bytes.

Parameters

- **w** – Word list to use. Pass NULL to use the default English list.
- **bytes** – Entropy to convert.
- **bytes_len** – The length of bytes in bytes.
- **output** – Destination for the resulting mnemonic sentence.

Note: The string returned should be freed using [wally_free_string](#).

Returns See [Error Codes](#)

```
int bip39_mnemonic_to_bytes (const struct words *w, const char *mnemonic, unsigned char *bytes_out,
                             size_t len, size_t *written)
```

Convert a mnemonic sentence into entropy at bytes_out.

Parameters

- **w** – Word list to use. Pass NULL to use the default English list.
- **mnemonic** – Mnemonic to convert.
- **bytes_out** – Where to store the resulting entropy.
- **len** – The length of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out.

Returns See [Variable Length Output Buffers](#)

```
int bip39_mnemonic_validate (const struct words *w, const char *mnemonic)
```

Validate the checksum embedded in a mnemonic sentence.

Parameters

- **w** – Word list to use. Pass NULL to use the default English list.
- **mnemonic** – Mnemonic to validate.

Returns See [Error Codes](#)

```
int bip39_mnemonic_to_seed (const char *mnemonic, const char *passphrase, unsigned char *bytes_out,
                            size_t len, size_t *written)
```

Convert a mnemonic into a binary seed.

Parameters

- **mnemonic** – Mnemonic to convert.
- **passphrase** – Mnemonic passphrase or NULL if no passphrase is needed.
- **bytes_out** – The destination for the binary seed.
- **len** – The length of bytes_out in bytes. Currently This must be BIP39_SEED_LEN_512.
- **written** – Destination for the number of bytes written to bytes_out.

Returns See [Variable Length Output Buffers](#)

CHAPTER 7

Map Functions

```
int wally_map_init (size_t allocation_len, wally_map_verify_fn_t verify_fn, struct wally_map *output)
Initialize a new map.
```

Parameters

- **allocation_len** – The number of items to allocate space for.
- **output** – Map to initialize.

Returns See [Error Codes](#)

```
int wally_map_init_alloc (size_t allocation_len, wally_map_verify_fn_t verify_fn, struct
wally_map **output)
Allocate and initialize a new map.
```

Parameters

- **allocation_len** – The number of items to allocate space for.
- **output** – Destination for the new map.

Returns See [Error Codes](#)

```
int wally_map_free (struct wally_map *map_in)
Free a map allocated by wally\_map\_init\_alloc.
```

Parameters

- **map_in** – The map to free.

Returns See [Error Codes](#)

```
int wally_map_clear (struct wally_map *map_in)
Remove all entries from a map.
```

Parameters

- **map_in** – The map to clear.

Note: This function frees all pre-allocated memory, and thus can be used to free a map initialised with `wally_map_init` without freeing the map struct itself.

Returns See *Error Codes*

```
int wally_map_add(struct wally_map *map_in, const unsigned char *key, size_t key_len, const unsigned
                  char *value, size_t value_len)
```

Add an item to a map.

Parameters

- **map_in** – The map to add to.
- **key** – The key to add.
- **key_len** – Length of key in bytes.
- **value** – The value to add.
- **value_len** – Length of value in bytes.

Note: If the key given is already in the map, this call succeeds without altering the map.

Returns See *Error Codes*

```
int wally_map_add_integer(struct wally_map *map_in, uint32_t key, const unsigned char *value,
                           size_t value_len)
```

Add an item to a map keyed by an integer.

As per `wally_map_add`, using an integer key.

Returns See *Error Codes*

```
int wally_map_replace(struct wally_map *map_in, const unsigned char *key, size_t key_len, const un-
                      signed char *value, size_t value_len)
```

Add an item to a map, replacing it if already present.

See `wally_map_add`.

Returns See *Error Codes*

```
int wally_map_replace_integer(struct wally_map *map_in, uint32_t key, const unsigned char *value,
                               size_t value_len)
```

Add an item to a map keyed by an integer, replacing it if already present.

See `wally_map_add_integer`.

Returns See *Error Codes*

```
int wally_map_remove(struct wally_map *map_in, const unsigned char *key, size_t key_len)
```

Remove an item from a map.

Parameters

- **map_in** – The map to remove from.
- **key** – The key to add.
- **key_len** – Length of key in bytes.

Returns See *Error Codes*

`int wally_map_remove_integer (struct wally_map *map_in, uint32_t key)`
Remove an item from a map keyed by an integer.

See [wally_map_remove_integer](#).

Returns See [Error Codes](#)

`int wally_map_find (const struct wally_map *map_in, const unsigned char *key, size_t key_len, size_t *written)`
Find an item in a map.

Parameters

- **map_in** – The map to find key in.
- **key** – The key to find.
- **key_len** – Length of key in bytes.
- **written** – On success, set to zero if the item is not found, otherwise the index of the item plus one.

Returns See [Error Codes](#)

`int wally_map_find_integer (const struct wally_map *map_in, uint32_t key, size_t *written)`
Find an item in a map keyed by an integer.

As per [wally_map_find](#), using an integer key.

Returns See [Error Codes](#)

`const struct wally_map_item *wally_map_get (const struct wally_map *map_in, const unsigned char *key, size_t key_len)`
Find an item in a map.

Parameters

- **map_in** – The map to find key in.
- **key** – The key to find.
- **key_len** – Length of key in bytes.

Note: This is a non-standard call for low-level use. It returns the map item directly without copying, or NULL if not found/an error occurs.

`const struct wally_map_item *wally_map_get_integer (const struct wally_map *map_in, uint32_t key)`
Find an item in a map keyed by an integer.

As per [wally_map_get](#), using an integer key.

`int wally_map_get_item_length (const struct wally_map *map_in, size_t index, size_t *written)`
Get the length of an item in a map.

Parameters

- **map_in** – The map to return the item length from.
- **index** – The zero-based index of the item whose length to return.
- **written** – Destination for the length of the item in bytes.

Returns See [Error Codes](#)

```
int wally_map_get_item(const struct wally_map *map_in, size_t index, unsigned char *bytes_out,
                      size_t len, size_t *written)
```

Return an item from a map.

Parameters

- **map_in** – The map to return the item from.
- **index** – The zero-based index of the item to return.
- **bytes_out** – Destination for the resulting data.
- **len** – The length of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out.

Returns See [Variable Length Output Buffers](#)

```
int wally_map_sort(struct wally_map *map_in, uint32_t flags)
```

Sort the items in a map.

Parameters

- **map_in** – The map to sort.
- **flags** – Flags controlling sorting. Must be 0.

Returns See [Error Codes](#)

```
int wally_map_combine(struct wally_map *map_in, const struct wally_map *source)
```

Combine the items from a source map into another map.

Parameters

- **map_in** – the destination to combine into.
- **source** – the source to copy items from.

Note: If this call fails, map_in may be left partially updated.

Returns See [Error Codes](#)

```
int wally_map_assign(struct wally_map *map_in, const struct wally_map *source)
```

Replace a maps contents with another map.

Parameters

- **map_in** – the destination to combine into.
- **source** – the source to copy items from.

Note: If this call fails, map_in is left untouched.

Returns See [Error Codes](#)

```
int wally_keypath_bip32_verify(const unsigned char *key, size_t key_len, const unsigned char *val,
                                size_t val_len)
```

Verify a PSBT keypath keyed by a serialized bip32 extended public key.

Parameters

- **key** – An extended public key in bip32 format.

- **key_len** – Length of `key` in bytes. Must be `BIP32_SERIALIZED_LEN`.
- **val** – The 4 byte PSBT serialized master key fingerprint followed by the serialized path.
- **val_len** – Length of `val` in bytes.

Returns See [Error Codes](#)

```
int wally_keypath_public_key_verify(const unsigned char *key, size_t key_len, const unsigned
                                    char *val, size_t val_len)
```

Verify a PSBT keypath keyed by a compressed or uncompressed public key.

Parameters

- **key** – Public key bytes.
- **key_len** – Length of `key` in bytes. Must be `EC_PUBLIC_KEY_UNCOMPRESSED_LEN` or `BIP32_SERIALIZED_LEN`.
- **val** – The 4 byte PSBT serialized master key fingerprint followed by the serialized path.
- **val_len** – Length of `val` in bytes.

Returns See [Error Codes](#)

```
int wally_keypath_xonly_public_key_verify(const unsigned char *key, size_t key_len, const un-
                                         signed char *val, size_t val_len)
```

Verify a PSBT keypath keyed by an x-only public key.

Parameters

- **key** – Public key bytes.
- **key_len** – Length of `key` in bytes. Must be `EC_XONLY_PUBLIC_KEY_LEN`,
- **val** – The 4 byte PSBT serialized master key fingerprint followed by the serialized path.
- **val_len** – Length of `val` in bytes.

Returns See [Error Codes](#)

```
int wally_map_keypath_bip32_init_alloc(size_t allocation_len, struct wally_map **output)
```

Allocate and initialize a new BIP32 keypath map.

Parameters

- **allocation_len** – The number of items to allocate space for.
- **output** – Destination for the new map.

Returns See [Error Codes](#)

```
int wally_map_keypath_public_key_init_alloc(size_t allocation_len, struct wally_map **out-
                                             put)
```

Allocate and initialize a new public key keypath map.

Parameters

- **allocation_len** – The number of items to allocate space for.
- **output** – Destination for the new map.

Returns See [Error Codes](#)

```
int wally_map_keypath_add(struct wally_map *map_in, const unsigned char *pub_key,
                           size_t pub_key_len, const unsigned char *fingerprint, size_t finger-
                           print_len, const uint32_t *child_path, size_t child_path_len)
```

Convert and add a public key and path to a keypath map.

Parameters

- **map_in** – The keypath map to add to.
- **pub_key** – The public key or extended public key to add.
- **pub_key_len** – Length of pub_key in bytes. Must be BIP32_SERIALIZED_LEN for an extended bip32 public key, or EC_PUBLIC_KEY_UNCOMPRESSED_LEN or EC_PUBLIC_KEY_LEN for a public key.
- **fingerprint** – The master key fingerprint for the pubkey.
- **fingerprint_len** – Length of fingerprint in bytes. Must be BIP32_KEY_FINGERPRINT_LEN.
- **child_path** – The BIP32 derivation path for the pubkey.
- **child_path_len** – The number of items in child_path.

Returns See [Error Codes](#)

```
int wally_map_hash_preimage_verify(const unsigned char *key, size_t key_len, const unsigned char *val, size_t val_len)
```

Verify a preimage map key and value pair.

Parameters

- **key** – The preimage hash, prefixed by a hash type byte.
- **key_len** – Length of key in bytes.
- **val** – The preimage data hashed to produce key.
- **val_len** – Length of val in bytes.

Note: Multiple preimage types are stored in the same map, prefixed by a leading byte. The exact format of storage is implementation dependent and may change in the future.

Returns See [Error Codes](#)

```
int wally_map_preimage_init_alloc(size_t allocation_len, struct wally_map **output)
```

Allocate and initialize a new preimage map.

Parameters

- **allocation_len** – The number of items to allocate space for.
- **output** – Destination for the new map.

Returns See [Error Codes](#)

```
int wally_map_preimage_ripemd160_add(struct wally_map *map_in, const unsigned char *value, size_t value_len)
```

Add a ripemd160 preimage to a preimage map.

Parameters

- **map_in** – The preimage map to add to.
- **value** – The data to store.
- **value_len** – Length of value in bytes.

Returns See [Error Codes](#)

```
int wally_map_preimage_sha256_add(struct wally_map *map_in, const unsigned char *value,
                                   size_t value_len)
```

Add a sha256 preimage to a preimage map.

Parameters

- **map_in** – The preimage map to add to.
- **value** – The data to store.
- **value_len** – Length of value in bytes.

Returns

 See [Error Codes](#)

```
int wally_map_preimage_hash160_add(struct wally_map *map_in, const unsigned char *value,
                                   size_t value_len)
```

Add a hash160 preimage to a preimage map.

Parameters

- **map_in** – The preimage map to add to.
- **value** – The data to store.
- **value_len** – Length of value in bytes.

Returns

 See [Error Codes](#)

```
int wally_map_preimage_sha256d_add(struct wally_map *map_in, const unsigned char *value,
                                   size_t value_len)
```

Add a sha256d preimage to a preimage map.

Parameters

- **map_in** – The preimage map to add to.
- **value** – The data to store.
- **value_len** – Length of value in bytes.

Returns

 See [Error Codes](#)

CHAPTER 8

Psbt Functions

```
int wally_psbt_input_set_previous_txid(struct wally_psbt_input *input, const unsigned char *txhash, size_t txhash_len)
```

Set the previous txid in an input.

Parameters

- **input** – The input to update.
- **txhash** – The previous hash for this input.
- **txhash_len** – Length of txhash in bytes. Must be WALLY_TXHASH_LEN.

Returns

See [Error Codes](#)

```
int wally_psbt_input_set_output_index(struct wally_psbt_input *input, uint32_t index)
```

Set the output index in an input.

Parameters

- **input** – The input to update.
- **index** – The index of the spent output for this input.

Returns

See [Error Codes](#)

```
int wally_psbt_input_set_sequence(struct wally_psbt_input *input, uint32_t sequence)
```

Set the sequence number in an input.

Parameters

- **input** – The input to update.
- **sequence** – The sequence number for this input.

Returns

See [Error Codes](#)

```
int wally_psbt_input_clear_sequence(struct wally_psbt_input *input)
```

Clear the sequence number in an input.

Parameters

- **input** – The input to update.

Returns See *Error Codes*

```
int wally_psbt_input_set_utxo (struct wally_psbt_input *input, const struct wally_tx *utxo)  
Set the utxo in an input.
```

Parameters

- **input** – The input to update.
- **utxo** – The (non witness) utxo for this input if it exists.

Returns See *Error Codes*

```
int wally_psbt_input_set_witness_utxo (struct wally_psbt_input *input, const struct  
wally_tx_output *witness_utxo)  
Set the witness_utxo in an input.
```

Parameters

- **input** – The input to update.
- **witness_utxo** – The witness utxo for this input if it exists.

Returns See *Error Codes*

```
int wally_psbt_input_set_witness_utxo_from_tx (struct wally_psbt_input *input, const struct  
wally_tx *utxo, uint32_t index)  
Set the witness_utxo in an input from a transaction output.
```

Parameters

- **input** – The input to update.
- **utxo** – The transaction containing the output to add.
- **index** – The output index in **utxo** to add.

Returns See *Error Codes*

```
int wally_psbt_input_set_redeem_script (struct wally_psbt_input *input, const unsigned  
char *script, size_t script_len)  
Set the redeem_script in an input.
```

Parameters

- **input** – The input to update.
- **script** – The redeem script for this input.
- **script_len** – Length of **script** in bytes.

Returns See *Error Codes*

```
int wally_psbt_input_set_witness_script (struct wally_psbt_input *input, const unsigned  
char *script, size_t script_len)  
Set the witness_script in an input.
```

Parameters

- **input** – The input to update.
- **script** – The witness script for this input.
- **script_len** – Length of **script** in bytes.

Returns See *Error Codes*

```
int wally_psbt_input_set_final_scriptsig(struct wally_psbt_input *input, const unsigned char *final_scriptsig, size_t final_scriptsig_len)
```

Set the final_scriptsig in an input.

Parameters

- **input** – The input to update.
- **final_scriptsig** – The scriptSig for this input.
- **final_scriptsig_len** – Length of `final_scriptsig` in bytes.

Returns

 See [Error Codes](#)

```
int wally_psbt_input_set_final_witness(struct wally_psbt_input *input, const struct wally_tx_witness_stack *witness)
```

Set the final witness in an input.

Parameters

- **input** – The input to update.
- **witness** – The witness stack for the input, or NULL if not present.

Returns

 See [Error Codes](#)

```
int wally_psbt_input_set_keypaths(struct wally_psbt_input *input, const struct wally_map *map_in)
```

Set the keypaths in an input.

Parameters

- **input** – The input to update.
- **map_in** – The HD keypaths for this input.

Returns

 See [Error Codes](#)

```
int wally_psbt_input_find_keypath(struct wally_psbt_input *input, const unsigned char *pub_key, size_t pub_key_len, size_t *written)
```

Find a keypath matching a pubkey in an input.

Parameters

- **input** – The input to search in.
- **pub_key** – The pubkey to find.
- **pub_key_len** – Length of `pub_key` in bytes. Must be `EC_PUBLIC_KEY_UNCOMPRESSED_LEN` or `EC_PUBLIC_KEY_LEN`.
- **written** – On success, set to zero if the item is not found, otherwise the index of the item plus one.

Returns

 See [Error Codes](#)

```
int wally_psbt_input_keypath_add(struct wally_psbt_input *input, const unsigned char *pub_key, size_t pub_key_len, const unsigned char *fingerprint, size_t fingerprint_len, const uint32_t *child_path, size_t child_path_len)
```

Convert and add a pubkey/keypath to an input.

Parameters

- **input** – The input to add to.
- **pub_key** – The pubkey to add.

- **pub_key_len** – Length of pub_key in bytes. Must be EC_PUBLIC_KEY_UNCOMPRESSED_LEN or EC_PUBLIC_KEY_LEN.
- **fingerprint** – The master key fingerprint for the pubkey.
- **fingerprint_len** – Length of fingerprint in bytes. Must be BIP32_KEY_FINGERPRINT_LEN.
- **child_path** – The BIP32 derivation path for the pubkey.
- **child_path_len** – The number of items in child_path.

Returns See [Error Codes](#)

```
int wally_psbt_input_set_signatures(struct wally_psbt_input *input, const struct wally_map *map_in)
```

Set the partial signatures in an input.

Parameters

- **input** – The input to update.
- **map_in** – The partial signatures for this input.

Returns See [Error Codes](#)

```
int wally_psbt_input_find_signature(struct wally_psbt_input *input, const unsigned char *pub_key, size_t pub_key_len, size_t *written)
```

Find a partial signature matching a pubkey in an input.

Parameters

- **input** – The input to search in.
- **pub_key** – The pubkey to find.
- **pub_key_len** – Length of pub_key in bytes. Must be EC_PUBLIC_KEY_UNCOMPRESSED_LEN or EC_PUBLIC_KEY_LEN.
- **written** – On success, set to zero if the item is not found, otherwise the index of the item plus one.

Returns See [Error Codes](#)

```
int wally_psbt_input_add_signature(struct wally_psbt_input *input, const unsigned char *pub_key, size_t pub_key_len, const unsigned char *sig, size_t sig_len)
```

Add a pubkey/partial signature item to an input.

Parameters

- **input** – The input to add the partial signature to.
- **pub_key** – The pubkey to find.
- **pub_key_len** – Length of pub_key in bytes. Must be EC_PUBLIC_KEY_UNCOMPRESSED_LEN or EC_PUBLIC_KEY_LEN.
- **sig** – The DER-encoded signature plus sighash byte to add.
- **sig_len** – The length of sig in bytes.

Returns See [Error Codes](#)

```
int wally_psbt_input_set_unknowns(struct wally_psbt_input *input, const struct wally_map *map_in)
```

Set the unknown values in an input.

Parameters

- **input** – The input to update.
- **map_in** – The unknown key value pairs for this input.

Returns See *Error Codes*

```
int wally_psbt_input_find_unknown(struct wally_psbt_input *input, const unsigned char *key,  
                                  size_t key_len, size_t *written)
```

Find an unknown item matching a key in an input.

Parameters

- **input** – The input to search in.
- **key** – The key to find.
- **key_len** – Length of key in bytes.
- **written** – On success, set to zero if the item is not found, otherwise the index of the item plus one.

Returns See *Error Codes*

```
int wally_psbt_input_set_sighash(struct wally_psbt_input *input, uint32_t sighash)
```

Set the sighash type in an input.

Parameters

- **input** – The input to update.
- **sighash** – The sighash type for this input.

Returns See *Error Codes*

```
int wally_psbt_input_set_required_locktime(struct wally_psbt_input *input, uint32_t re-  
                                            quired_locktime)
```

Set the required lock time in an input.

Parameters

- **input** – The input to update.
- **required_locktime** – The required locktime for this input.

Returns See *Error Codes*

```
int wally_psbt_input_clear_required_locktime(struct wally_psbt_input *input)
```

Clear the required lock time in an input.

Parameters

- **input** – The input to update.

Returns See *Error Codes*

```
int wally_psbt_input_set_required_lockheight(struct wally_psbt_input *input, uint32_t re-  
                                              quired_lockheight)
```

Set the required lock height in an input.

Parameters

- **input** – The input to update.
- **required_lockheight** – The required locktime for this input.

Returns See *Error Codes*

```
int wally_psbt_input_clear_required_lockheight (struct wally_psbt_input *input)
    Clear the required lock height in an input.
```

Parameters

- **input** – The input to update.

Returns See *Error Codes*

```
int wally_psbt_input_set_amount (struct wally_psbt_input *input, uint64_t amount)
    Set the unblinded amount in an input.
```

Parameters

- **input** – The input to update.
- **amount** – The amount of the input.

Note: This operates on the PSET field PSBT_ELEMENTS_IN_EXPLICIT_VALUE.

Returns See *Error Codes*

```
int wally_psbt_input_get_amount_rangeproof (const struct wally_psbt_input *input, unsigned
                                             char *bytes_out, size_t len, size_t *written)
    Get the explicit amount rangeproof from an input.
```

Parameters

- **input** – The input to get from.
- **bytes_out** – Destination for the explicit amount rangeproof.
- **len** – Size of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_IN_VALUE_PROOF.

Returns See *Variable Length Output Buffers*

```
int wally_psbt_input_get_amount_rangeproof_len (const struct wally_psbt_input *input,
                                                size_t *written)
```

Get the length of the explicit amount rangeproof from an input.

Parameters

- **input** – The input to get from.
- **written** – Destination for the length, or zero if not present.

Returns See *Error Codes*

```
int wally_psbt_input_set_amount_rangeproof (struct wally_psbt_input *input, const unsigned
                                             char *rangeproof, size_t rangeproof_len)
```

Set the explicit amount rangeproof in an input.

Parameters

- **input** – The input to update.

- **rangeproof** – The explicit amount rangeproof.
- **rangeproof_len** – Size of rangeproof in bytes.

Returns See *Error Codes*

```
int wally_psbt_input_clear_amount_rangeproof(struct wally_psbt_input *input)
```

Clear the explicit amount rangeproof in an input.

Parameters

- **input** – The input to update.

Returns See *Error Codes*

```
int wally_psbt_input_get_asset(const struct wally_psbt_input *input, unsigned char *bytes_out,
                               size_t len, size_t *written)
```

Get the explicit asset tag from an input.

Parameters

- **input** – The input to get from.
- **bytes_out** – Destination for the explicit asset tag.
- **len** – Size of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_IN_EXPLICIT_ASSET.

Returns See *Variable Length Output Buffers*

```
int wally_psbt_input_get_asset_len(const struct wally_psbt_input *input, size_t *written)
```

Get the length of the explicit asset tag from an input.

Parameters

- **input** – The input to get from.
- **written** – Destination for the length, or zero if not present.

Returns See *Error Codes*

```
int wally_psbt_input_set_asset(struct wally_psbt_input *input, const unsigned char *asset,
                               size_t asset_len)
```

Set the explicit asset tag in an input.

Parameters

- **input** – The input to update.
- **asset** – The explicit asset tag.
- **asset_len** – Size of asset in bytes.

Returns See *Error Codes*

```
int wally_psbt_input_clear_asset(struct wally_psbt_input *input)
```

Clear the explicit asset tag in an input.

Parameters

- **input** – The input to update.

Returns See [Error Codes](#)

```
int wally_psbt_input_get_asset_surjectionproof(const struct wally_psbt_input *input,
                                               unsigned char *bytes_out, size_t len,
                                               size_t *written)
```

Get the explicit asset surjection proof from an input.

Parameters

- **input** – The input to get from.
- **bytes_out** – Destination for the explicit asset surjection proof.
- **len** – Size of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_IN_ASSET_PROOF.

Returns See [Variable Length Output Buffers](#)

```
int wally_psbt_input_get_asset_surjectionproof_len(const struct wally_psbt_input *input,
                                                   size_t *written)
```

Get the length of the explicit asset surjection proof from an input.

Parameters

- **input** – The input to get from.
- **written** – Destination for the length, or zero if not present.

Returns See [Error Codes](#)

```
int wally_psbt_input_set_asset_surjectionproof(struct wally_psbt_input *input, const unsigned char *surjectionproof, size_t surjectionproof_len)
```

Set the explicit asset surjection proof in an input.

Parameters

- **input** – The input to update.
- **surjectionproof** – The explicit asset surjection proof.
- **surjectionproof_len** – Size of surjectionproof in bytes.

Returns See [Error Codes](#)

```
int wally_psbt_input_clear_asset_surjectionproof(struct wally_psbt_input *input)
```

Clear the explicit asset surjection proof in an input.

Parameters

- **input** – The input to update.

Returns See [Error Codes](#)

```
int wally_psbt_input_set_issuance_amount(struct wally_psbt_input *input, uint64_t amount)
```

Set the unblinded token issuance amount in an input.

Parameters

- **input** – The input to update.

- **amount** – The issuance amount.

Note: Setting the amount to zero indicates no issuance.

Returns See *Error Codes*

```
int wally_psbt_input_set_inflation_keys (struct wally_psbt_input *input, uint64_t value)
```

Set the unblinded number of inflation (reissuance) keys in an input.

Parameters

- **input** – The input to update.
- **value** – The number of inflation keys.

Returns See *Error Codes*

```
int wally_psbt_input_set_pegin_amount (struct wally_psbt_input *input, uint64_t amount)
```

Set the peg-in amount in an input.

Parameters

- **input** – The input to update.
- **amount** – The peg-in amount.

Returns See *Error Codes*

```
int wally_psbt_input_set_pegin_tx (struct wally_psbt_input *input, const struct wally_tx *tx)
```

Set the peg-in transaction in an input.

Parameters

- **input** – The input to update.
- **tx** – The (non witness) peg-in transaction for this input if it exists.

Returns See *Error Codes*

```
int wally_psbt_input_set_pegin_witness (struct wally_psbt_input *input, const struct wally_tx_witness_stack *witness)
```

Set the peg-in witness in an input.

Parameters

- **input** – The input to update.
- **witness** – The peg-in witness stack for the input, or NULL if not present.

Returns See *Error Codes*

```
int wally_psbt_input_get_pegin_txout_proof (const struct wally_psbt_input *input, unsigned char *bytes_out, size_t len, size_t *written)
```

Get the peg-in transaction output proof from an input.

Parameters

- **input** – The input to get from.
- **bytes_out** – Destination for the peg-in transaction output proof.
- **len** – Size of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_IN_PEG_IN_TXOUT_PROOF.

Returns See *Variable Length Output Buffers*

```
int wally_psbt_input_get_pegin_txout_proof_len(const struct wally_psbt_input *input,  
                                              size_t *written)
```

Get the length of a peg-in transaction output proof from an input.

Parameters

- **input** – The input to get from.
- **written** – Destination for the length, or zero if not present.

Returns See *Error Codes*

```
int wally_psbt_input_set_pegin_txout_proof(struct wally_psbt_input *input, const unsigned  
                                            char *txout_proof, size_t txout_proof_len)
```

Set the peg-in transaction output proof in an input.

Parameters

- **input** – The input to update.
- **txout_proof** – The peg-in transaction output proof.
- **txout_proof_len** – Size of txout_proof in bytes.

Returns See *Error Codes*

```
int wally_psbt_input_clear_pegin_txout_proof(struct wally_psbt_input *input)
```

Clear the peg-in transaction output proof in an input.

Parameters

- **input** – The input to update.

Returns See *Error Codes*

```
int wally_psbt_input_get_pegin_genesis_blockhash(const struct wally_psbt_input *input,  
                                                unsigned char *bytes_out, size_t len,  
                                                size_t *written)
```

Get the peg-in genesis blockhash from an input.

Parameters

- **input** – The input to get from.
- **bytes_out** – Destination for the peg-in genesis blockhash.
- **len** – Size of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out. Will be zero if the value is not present.

Returns See *Variable Length Output Buffers*

```
int wally_psbt_input_get_pegin_genesis_blockhash_len(const struct wally_psbt_input *in-  
                                                   put, size_t *written)
```

Get the length of a peg-in genesis blockhash from an input.

Parameters

- **input** – The input to get from.

- **written** – Destination for the length, or zero if not present.

Note: This operates on the PSET field PSBT_ELEMENTS_IN_PEG_IN_GENESIS_HASH.

Returns See *Error Codes*

```
int wally_psbt_input_set_pegin_genesis_blockhash(struct wally_psbt_input *input, const
                                                unsigned char *genesis_blockhash,
                                                size_t genesis_blockhash_len)
```

Set the peg-in genesis blockhash in an input.

Parameters

- **input** – The input to update.
- **genesis_blockhash** – The peg-in genesis blockhash.
- **genesis_blockhash_len** – Size of genesis_blockhash in bytes. Must be WALLY_TXHASH_LEN.

Returns See *Error Codes*

```
int wally_psbt_input_clear_pegin_genesis_blockhash(struct wally_psbt_input *input)
```

Clear the peg-in genesis blockhash in an input.

Parameters

- **input** – The input to update.

Returns See *Error Codes*

```
int wally_psbt_input_get_pegin_claim_script(const struct wally_psbt_input *input, unsigned
                                             char *bytes_out, size_t len, size_t *written)
```

Get the peg-in claim script from an input.

Parameters

- **input** – The input to get from.
- **bytes_out** – Destination for the peg-in claim script.
- **len** – Size of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_IN_PEG_IN_CLAIM_SCRIPT.

Returns See *Variable Length Output Buffers*

```
int wally_psbt_input_get_pegin_claim_script_len(const struct wally_psbt_input *input,
                                                size_t *written)
```

Get the length of a peg-in claim script from an input.

Parameters

- **input** – The input to get from.
- **written** – Destination for the length, or zero if not present.

Returns See *Error Codes*

```
int wally_psbt_input_set_pegin_claim_script(struct wally_psbt_input *input, const unsigned
                                             char *script, size_t script_len)
```

Set the peg-in claim script in an input.

Parameters

- **input** – The input to update.
- **script** – The peg-in claim script.
- **script_len** – Size of `script` in bytes.

Returns

 See [Error Codes](#)

```
int wally_psbt_input_clear_pegin_claim_script(struct wally_psbt_input *input)
```

Clear the peg-in claim script in an input.

Parameters

- **input** – The input to update.

Returns

 See [Error Codes](#)

```
int wally_psbt_input_get_issuance_amount_commitment(const struct wally_psbt_input *in-
                                                       put, unsigned char *bytes_out,
                                                       size_t len, size_t *written)
```

Get the blinded token issuance amount from an input.

Parameters

- **input** – The input to get from.
- **bytes_out** – Destination for the blinded issuance amount.
- **len** – Size of `bytes_out` in bytes. Must be ASSET_COMMITMENT_LEN.
- **written** – Destination for the number of bytes written to `bytes_out`. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_IN_ISSUANCE_VALUE_COMMITMENT.

Returns

 See [Variable Length Output Buffers](#)

```
int wally_psbt_input_get_issuance_amount_commitment_len(const struct wally_psbt_input *input,
                                                       size_t *written)
```

Get the length of a blinded token issuance amount from an input.

Parameters

- **input** – The input to get from.
- **written** – Destination for the length, or zero if not present.

Returns

 See [Error Codes](#)

```
int wally_psbt_input_set_issuance_amount_commitment(struct wally_psbt_input *input,
                                                       const unsigned char *commitment,
                                                       size_t commitment_len)
```

Set the blinded token issuance amount in an input.

Parameters

- **input** – The input to update.

- **commitment** – The blinded issuance amount commitment.
- **commitment_len** – Size of commitment in bytes. Must be ASSET_COMMITMENT_LEN.

Returns See *Error Codes*

```
int wally_psbt_input_clear_issuance_amount_commitment(struct wally_psbt_input *input)
```

Clear the blinded token issuance amount in an input.

Parameters

- **input** – The input to update.

Returns See *Error Codes*

```
int wally_psbt_input_get_issuance_amount_rangeproof(const struct wally_psbt_input *input,
                                                    unsigned char *bytes_out,
                                                    size_t len, size_t *written)
```

Get the issuance amount rangeproof from an input.

Parameters

- **input** – The input to get from.
- **bytes_out** – Destination for the issuance amount rangeproof.
- **len** – Size of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_IN_ISSUANCE_VALUE_Rangeproof.

Returns See *Variable Length Output Buffers*

```
int wally_psbt_input_get_issuance_amount_rangeproof_len(const struct wally_psbt_input *input,
                                                       size_t *written)
```

Get the length of the issuance amount rangeproof from an input.

Parameters

- **input** – The input to get from.
- **written** – Destination for the length, or zero if not present.

Returns See *Error Codes*

```
int wally_psbt_input_set_issuance_amount_rangeproof(struct wally_psbt_input *input,
                                                    const unsigned char *rangeproof,
                                                    size_t rangeproof_len)
```

Set the issuance amount rangeproof in an input.

Parameters

- **input** – The input to update.
- **rangeproof** – The issuance amount rangeproof.
- **rangeproof_len** – Size of rangeproof in bytes.

Returns See *Error Codes*

```
int wally_psbt_input_clear_issuance_amount_rangeproof (struct wally_psbt_input *input)
Clear the issuance amount rangeproof in an input.
```

Parameters

- **input** – The input to update.

Returns See *Error Codes*

```
int wally_psbt_input_get_issuance_blinding_nonce (const struct wally_psbt_input *input,
                                                unsigned char *bytes_out, size_t len,
                                                size_t *written)
```

Get the asset issuance blinding nonce from an input.

Parameters

- **input** – The input to get from.
- **bytes_out** – Destination for the asset issuance blinding nonce.
- **len** – Size of bytes_out in bytes. Must be BLINDING_FACTOR_LEN.
- **written** – Destination for the number of bytes written to bytes_out. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_IN_ISSUANCE_BLINDING_NONCE.

Returns See *Variable Length Output Buffers*

```
int wally_psbt_input_get_issuance_blinding_nonce_len (const struct wally_psbt_input *input,
                                                       size_t *written)
```

Get the length of a asset issuance blinding nonce from an input.

Parameters

- **input** – The input to get from.
- **written** – Destination for the length, or zero if not present.

Returns See *Error Codes*

```
int wally_psbt_input_set_issuance_blinding_nonce (struct wally_psbt_input *input,
                                                 const unsigned char *nonce,
                                                 size_t nonce_len)
```

Set the asset issuance blinding nonce in an input.

Parameters

- **input** – The input to update.
- **nonce** – Asset issuance or revelation blinding nonce.
- **nonce_len** – Size of nonce in bytes. Must be WALLY_TX_ASSET_TAG_LEN.

Returns See *Error Codes*

```
int wally_psbt_input_clear_issuance_blinding_nonce (struct wally_psbt_input *input)
Clear the asset issuance blinding nonce in an input.
```

Parameters

- **input** – The input to update.

Returns See *Error Codes*

```
int wally_psbt_input_get_issuance_asset_entropy(const struct wally_psbt_input *input,
                                              unsigned char *bytes_out, size_t len,
                                              size_t *written)
```

Get the asset issuance entropy from an input.

Parameters

- **input** – The input to get from.
- **bytes_out** – Destination for the asset issuance entropy.
- **len** – Size of bytes_out in bytes. Must be BLINDING_FACTOR_LEN.
- **written** – Destination for the number of bytes written to bytes_out. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_IN_ISSUANCE_ASSET_ENTROPY.

Returns

See [Variable Length Output Buffers](#)

```
int wally_psbt_input_get_issuance_asset_entropy_len(const struct wally_psbt_input *input,
                                                   size_t *written)
```

Get the length of a asset issuance entropy from an input.

Parameters

- **input** – The input to get from.
- **written** – Destination for the length, or zero if not present.

Returns

See [Error Codes](#)

```
int wally_psbt_input_set_issuance_asset_entropy(struct wally_psbt_input *input, const unsigned char *entropy, size_t entropy_len)
```

Set the asset issuance entropy in an input.

Parameters

- **input** – The input to update.
- **entropy** – The asset issuance entropy.
- **entropy_len** – Size of entropy in bytes.

Returns

See [Error Codes](#)

```
int wally_psbt_input_clear_issuance_asset_entropy(struct wally_psbt_input *input)
```

Clear the asset issuance entropy in an input.

Parameters

- **input** – The input to update.

Returns

See [Error Codes](#)

```
int wally_psbt_input_get_issuance_amount_blinding_rangeproof(const struct wally_psbt_input *input,
                                                               unsigned char *bytes_out, size_t len,
                                                               size_t *written)
```

Get the issuance amount blinding rangeproof from an input.

Parameters

- **input** – The input to get from.
- **bytes_out** – Destination for the issuance amount blinding rangeproof.
- **len** – Size of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_IN_ISSUANCE_BLIND_VALUE_PROOF.

Returns See *Variable Length Output Buffers*

```
int wally_psbt_input_get_issuance_amount_blinding_rangeproof_len(const struct  
                           wally_psbt_input *input,  
                           size_t *written)
```

Get the length of a issuance amount blinding rangeproof from an input.

Parameters

- **input** – The input to get from.
- **written** – Destination for the length, or zero if not present.

Returns See *Error Codes*

```
int wally_psbt_input_set_issuance_amount_blinding_rangeproof(struct  
                           wally_psbt_input *input,  
                           const unsigned char *rangeproof,  
                           size_t rangeproof_len)
```

Set the issuance amount blinding rangeproof in an input.

Parameters

- **input** – The input to update.
- **rangeproof** – The issuance amount blinding rangeproof.
- **rangeproof_len** – Size of rangeproof in bytes.

Returns See *Error Codes*

```
int wally_psbt_input_clear_issuance_amount_blinding_rangeproof(struct  
                           wally_psbt_input *input)
```

Clear the issuance amount blinding rangeproof in an input.

Parameters

- **input** – The input to update.

Returns See *Error Codes*

```
int wally_psbt_input_get_inflation_keys_commitment(const struct wally_psbt_input *input,  
                                                 unsigned char *bytes_out, size_t len,  
                                                 size_t *written)
```

Get the blinded number of reissuance tokens from an input.

Parameters

- **input** – The input to get from.
- **bytes_out** – Destination for the blinded number of reissuance tokens.
- **len** – Size of bytes_out in bytes. Must be ASSET_COMMITMENT_LEN.
- **written** – Destination for the number of bytes written to bytes_out. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_IN_INFLATION_KEYS_COMMITTMENT.

Returns See *Variable Length Output Buffers*

```
int wally_psbt_input_get_inflation_keys_commitment_len (const struct wally_psbt_input *input, size_t *written)
```

Get the length of the blinded number of reissuance tokens from an input.

Parameters

- **input** – The input to get from.
- **written** – Destination for the length, or zero if not present.

Returns See *Error Codes*

```
int wally_psbt_input_set_inflation_keys_commitment (struct wally_psbt_input *input, const unsigned char *commitment, size_t commitment_len)
```

Set the blinded number of reissuance tokens in an input.

Parameters

- **input** – The input to update.
- **commitment** – The blinded number of reissuance tokens.
- **commitment_len** – Size of commitment in bytes. Must be ASSET_COMMITMENT_LEN.

Returns See *Error Codes*

```
int wally_psbt_input_clear_inflation_keys_commitment (struct wally_psbt_input *input)
```

Clear the blinded number of reissuance tokens in an input.

Parameters

- **input** – The input to update.

Returns See *Error Codes*

```
int wally_psbt_input_get_inflation_keys_rangeproof (const struct wally_psbt_input *input, unsigned char *bytes_out, size_t len, size_t *written)
```

Get the reissuance tokens rangeproof from an input.

Parameters

- **input** – The input to get from.
- **bytes_out** – Destination for the reissuance tokens rangeproof.
- **len** – Size of bytes_out in bytes.

- **written** – Destination for the number of bytes written to `bytes_out`. Will be zero if the value is not present.

Note: This operates on the PSET field `PSBT_ELEMENTS_IN_INFLECTION_KEYS_Rangeproof`.

Returns See [Variable Length Output Buffers](#)

```
int wally_psbt_input_get_inflection_keys_rangeproof_len(const struct wally_psbt_input *input, size_t *written)
```

Get the length of a reissuance tokens rangeproof from an input.

Parameters

- **input** – The input to get from.
- **written** – Destination for the length, or zero if not present.

Returns See [Error Codes](#)

```
int wally_psbt_input_set_inflection_keys_rangeproof(const struct wally_psbt_input *input, const unsigned char *rangeproof, size_t rangeproof_len)
```

Set the reissuance tokens rangeproof in an input.

Parameters

- **input** – The input to update.
- **rangeproof** – The reissuance tokens rangeproof.
- **rangeproof_len** – Size of `rangeproof` in bytes.

Returns See [Error Codes](#)

```
int wally_psbt_input_clear_inflection_keys_rangeproof(struct wally_psbt_input *input)
```

Clear the reissuance tokens rangeproof in an input.

Parameters

- **input** – The input to update.

Returns See [Error Codes](#)

```
int wally_psbt_input_get_inflection_keys_blinding_rangeproof(const struct wally_psbt_input *input, unsigned char *bytes_out, size_t len, size_t *written)
```

Get the reissuance tokens blinding rangeproof from an input.

Parameters

- **input** – The input to get from.
- **bytes_out** – Destination for the reissuance tokens blinding rangeproof.
- **len** – Size of `bytes_out` in bytes.
- **written** – Destination for the number of bytes written to `bytes_out`. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_IN_ISSUANCE_BLIND_INFLECTION_KEYS_PROOF.

Returns See *Variable Length Output Buffers*

```
int wally_psbt_input_get_inflation_keys_blinding_rangeproof_len(const struct
                                                               wally_psbt_input *input,
                                                               size_t *written)
```

Get the length of a reissuance tokens blinding rangeproof from an input.

Parameters

- **input** – The input to get from.
- **written** – Destination for the length, or zero if not present.

Returns See *Error Codes*

```
int wally_psbt_input_set_inflation_keys_blinding_rangeproof(struct
                                                               wally_psbt_input *input,
                                                               const unsigned
                                                               char *rangeproof,
                                                               size_t rangeproof_len)
```

Set the reissuance tokens blinding rangeproof in an input.

Parameters

- **input** – The input to update.
- **rangeproof** – The reissuance tokens blinding rangeproof.
- **rangeproof_len** – Size of rangeproof in bytes.

Returns See *Error Codes*

```
int wally_psbt_input_clear_inflation_keys_blinding_rangeproof(struct
                                                               wally_psbt_input *input)
```

Clear the reissuance tokens blinding rangeproof in an input.

Parameters

- **input** – The input to update.

Returns See *Error Codes*

```
int wally_psbt_input_get_utxo_rangeproof(const struct wally_psbt_input *input,
                                         unsigned char *bytes_out, size_t len, size_t *written)
```

Get the UTXO rangeproof from an input.

Parameters

- **input** – The input to get from.
- **bytes_out** – Destination for the UTXO rangeproof.
- **len** – Size of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_IN_UTXO_RANGEPROOF.

Returns See *Variable Length Output Buffers*

```
int wally_psbt_input_get_utxo_rangeproof_len(const struct wally_psbt_input *input,
                                              size_t *written)
```

Get the length of a UTXO rangeproof from an input.

Parameters

- **input** – The input to get from.
- **written** – Destination for the length, or zero if not present.

Returns See *Error Codes*

```
int wally_psbt_input_set_utxo_rangeproof(struct wally_psbt_input *input, const unsigned
                                         char *rangeproof, size_t rangeproof_len)
```

Set the UTXO rangeproof in an input.

Parameters

- **input** – The input to update.
- **rangeproof** – The UTXO rangeproof.
- **rangeproof_len** – Size of rangeproof in bytes.

Returns See *Error Codes*

```
int wally_psbt_input_clear_utxo_rangeproof(struct wally_psbt_input *input)
```

Clear the UTXO rangeproof in an input.

Parameters

- **input** – The input to update.

Returns See *Error Codes*

```
int wally_psbt_input_generate_explicit_proofs(struct wally_psbt_input *input,
                                              uint64_t satoshi, const unsigned char *asset,
                                              size_t asset_len, const unsigned char *abf,
                                              size_t abf_len, const unsigned char *vbf,
                                              size_t vbf_len, const unsigned char *entropy,
                                              size_t entropy_len)
```

Generate explicit proofs and unblinded values from an inputs witness UTXO.

Parameters

- **input** – The input to update.
- **nonce_hash** – The blinding nonce for the inputs witness UTXO.
- **nonce_hash_len** – Size of nonce_hash in bytes. Must be SHA256_LEN.
- **entropy** – Random entropy for explicit range proof generation.
- **entropy_len** – Size of entropy in bytes. Must be BLINDING_FACTOR_LEN.

Note: This function exposes the unblinded asset and value in the PSET,

which is only appropriate in certain multi-party protocols.

Returns See *Error Codes*

```
int wally_psbt_input_is_finalized(const struct wally_psbt_input *input, size_t *written)
```

Determine if a PSBT input is finalized.

Parameters

- **input** – The input to check.
- **written** – On success, set to one if the input is finalized, otherwise zero.

Returns See *Error Codes*

```
int wally_psbt_output_set_redeem_script(struct wally_psbt_output *output, const unsigned char *script, size_t script_len)
```

Set the redeem_script in an output.

Parameters

- **output** – The input to update.
- **script** – The redeem script for this output.
- **script_len** – Length of `script` in bytes.

Returns See *Error Codes*

```
int wally_psbt_output_set_witness_script(struct wally_psbt_output *output, const unsigned char *script, size_t script_len)
```

Set the witness_script in an output.

Parameters

- **output** – The output to update.
- **script** – The witness script for this output.
- **script_len** – Length of `script` in bytes.

Returns See *Error Codes*

```
int wally_psbt_output_set_keypaths(struct wally_psbt_output *output, const struct wally_map *map_in)
```

Set the keypaths in an output.

Parameters

- **output** – The output to update.
- **map_in** – The HD keypaths for this output.

Returns See *Error Codes*

```
int wally_psbt_output_find_keypath(struct wally_psbt_output *output, const unsigned char *pub_key, size_t pub_key_len, size_t *written)
```

Find a keypath matching a pubkey in an output.

Parameters

- **output** – The output to search in.
- **pub_key** – The pubkey to find.
- **pub_key_len** – Length of `pub_key` in bytes. Must be `EC_PUBLIC_KEY_UNCOMPRESSED_LEN` or `EC_PUBLIC_KEY_LEN`.
- **written** – On success, set to zero if the item is not found, otherwise the index of the item plus one.

Returns See [Error Codes](#)

```
int wally_psbt_output_keypath_add(struct wally_psbt_output *output, const unsigned
                                  char *pub_key, size_t pub_key_len, const unsigned char *fin-
                                  gerprint, size_t fingerprint_len, const uint32_t *child_path,
                                  size_t child_path_len)
```

Convert and add a pubkey/keypath to an output.

Parameters

- **output** – The output to add to.
- **pub_key** – The pubkey to add.
- **pub_key_len** – Length of pub_key in bytes. Must be EC_PUBLIC_KEY_UNCOMPRESSED_LEN or EC_PUBLIC_KEY_LEN.
- **fingerprint** – The master key fingerprint for the pubkey.
- **fingerprint_len** – Length of fingerprint in bytes. Must be BIP32_KEY_FINGERPRINT_LEN.
- **child_path** – The BIP32 derivation path for the pubkey.
- **child_path_len** – The number of items in child_path.

Returns See [Error Codes](#)

```
int wally_psbt_output_set_unknowns(struct wally_psbt_output *output, const struct
                                   wally_map *map_in)
```

Set the unknown map in an output.

Parameters

- **output** – The output to update.
- **map_in** – The unknown key value pairs for this output.

Returns See [Error Codes](#)

```
int wally_psbt_output_find_unknown(struct wally_psbt_output *output, const unsigned char *key,
                                   size_t key_len, size_t *written)
```

Find an unknown item matching a key in an output.

Parameters

- **output** – The output to search in.
- **key** – The key to find.
- **key_len** – Length of key in bytes.
- **written** – On success, set to zero if the item is not found, otherwise the index of the item plus one.

Returns See [Error Codes](#)

```
int wally_psbt_output_set_amount(struct wally_psbt_output *output, uint64_t amount)
```

Set the amount in an output.

Parameters

- **output** – The output to update.
- **amount** – The amount for this output.

Returns See [Error Codes](#)

```
int wally_psbt_output_clear_amount (struct wally_psbt_output *output)
Clear the amount in an output.
```

Parameters

- **output** – The output to update.

Returns

 See *Error Codes*

```
int wally_psbt_output_set_script (struct wally_psbt_output *output, const unsigned char *script,
size_t script_len)
Set the script in an output.
```

Parameters

- **output** – The output to update.
- **script** – The script for this output.
- **script_len** – Length of script in bytes.

Returns

 See *Error Codes*

```
int wally_psbt_output_set_blinder_index (struct wally_psbt_output *output, uint32_t index)
Set the input blinder index in an output.
```

Parameters

- **output** – The output to update.
- **index** – The input blinder index for this output.

Returns

 See *Error Codes*

```
int wally_psbt_output_clear_blinder_index (struct wally_psbt_output *output)
Clear the input blinder index from an output.
```

Parameters

- **output** – The output to update.

Returns

 See *Error Codes*

```
int wally_psbt_output_get_value_commitment (const struct wally_psbt_output *output, unsigned
char *bytes_out, size_t len, size_t *written)
Get the blinded asset value from an output.
```

Parameters

- **output** – The output to get from.
- **bytes_out** – Destination for the blinded asset value.
- **len** – Size of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_OUT_VALUE_COMMITMENT.

Returns

 See *Variable Length Output Buffers*

```
int wally_psbt_output_get_value_commitment_len (const struct wally_psbt_output *output,
size_t *written)
```

Get the length of the blinded asset value from an output.

Parameters

- **output** – The output to get from.
- **written** – Destination for the length, or zero if not present.

Returns See [Error Codes](#)

```
int wally_psbt_output_set_value_commitment (struct wally_psbt_output *output, const unsigned char *commitment, size_t commitment_len)
```

Set the blinded asset value in an output.

Parameters

- **output** – The output to update.
- **commitment** – The blinded asset value.
- **commitment_len** – Size of commitment in bytes.

Returns See [Error Codes](#)

```
int wally_psbt_output_clear_value_commitment (struct wally_psbt_output *output)
```

Clear the blinded asset value in an output.

Parameters

- **output** – The output to update.

Returns See [Error Codes](#)

```
int wally_psbt_output_get_asset (const struct wally_psbt_output *output, unsigned char *bytes_out, size_t len, size_t *written)
```

Get the asset tag from an output.

Parameters

- **output** – The output to get from.
- **bytes_out** – Destination for the asset tag.
- **len** – Size of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_OUT_ASSET.

Returns See [Variable Length Output Buffers](#)

```
int wally_psbt_output_get_asset_len (const struct wally_psbt_output *output, size_t *written)
```

Get the length of the asset tag from an output.

Parameters

- **output** – The output to get from.
- **written** – Destination for the length, or zero if not present.

Returns See [Error Codes](#)

```
int wally_psbt_output_set_asset (struct wally_psbt_output *output, const unsigned char *asset, size_t asset_len)
```

Set the asset tag in an output.

Parameters

- **output** – The output to update.
- **asset** – The asset tag.
- **asset_len** – Size of asset in bytes.

Returns See [Error Codes](#)

```
int wally_psbt_output_clear_asset (struct wally_psbt_output *output)
```

Clear the asset tag in an output.

Parameters

- **output** – The output to update.

Returns See [Error Codes](#)

```
int wally_psbt_output_get_asset_commitment (const struct wally_psbt_output *output, unsigned
                                         char *bytes_out, size_t len, size_t *written)
```

Get the blinded asset tag from an output.

Parameters

- **output** – The output to get from.
- **bytes_out** – Destination for the blinded asset tag.
- **len** – Size of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_OUT_ASSET_COMMITMENT.

Returns See [Variable Length Output Buffers](#)

```
int wally_psbt_output_get_asset_commitment_len (const struct wally_psbt_output *output,
                                                size_t *written)
```

Get the length of the blinded asset tag from an output.

Parameters

- **output** – The output to get from.
- **written** – Destination for the length, or zero if not present.

Returns See [Error Codes](#)

```
int wally_psbt_output_set_asset_commitment (struct wally_psbt_output *output, const unsigned
                                         char *commitment, size_t commitment_len)
```

Set the blinded asset tag in an output.

Parameters

- **output** – The output to update.
- **commitment** – The blinded asset tag.
- **commitment_len** – Size of commitment in bytes.

Returns See [Error Codes](#)

```
int wally_psbt_output_clear_asset_commitment (struct wally_psbt_output *output)
```

Clear the blinded asset tag in an output.

Parameters

- **output** – The output to update.

Returns See *Error Codes*

```
int wally_psbt_output_get_value_rangeproof(const struct wally_psbt_output *output, unsigned
                                         char *bytes_out, size_t len, size_t *written)
```

Get the output value range proof from an output.

Parameters

- **output** – The output to get from.
- **bytes_out** – Destination for the output value range proof.
- **len** – Size of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_OUT_VALUE_Rangeproof.

Returns See *Variable Length Output Buffers*

```
int wally_psbt_output_get_value_rangeproof_len(const struct wally_psbt_output *output,
                                               size_t *written)
```

Get the length of the output value range proof from an output.

Parameters

- **output** – The output to get from.
- **written** – Destination for the length, or zero if not present.

Returns See *Error Codes*

```
int wally_psbt_output_set_value_rangeproof(struct wally_psbt_output *output, const unsigned
                                         char *rangeproof, size_t rangeproof_len)
```

Set the output value range proof in an output.

Parameters

- **output** – The output to update.
- **rangeproof** – The output value range proof.
- **rangeproof_len** – Size of rangeproof in bytes.

Returns See *Error Codes*

```
int wally_psbt_output_clear_value_rangeproof(struct wally_psbt_output *output)
```

Clear the output value range proof in an output.

Parameters

- **output** – The output to update.

Returns See *Error Codes*

```
int wally_psbt_output_get_asset_surjectionproof(const struct wally_psbt_output *output,
                                                unsigned char *bytes_out, size_t len,
                                                size_t *written)
```

Get the asset surjection proof from an output.

Parameters

- **output** – The output to get from.
- **bytes_out** – Destination for the asset surjection proof.
- **len** – Size of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_OUT_ASSET_SURJECTION_PROOF.

Returns See *Variable Length Output Buffers*

```
int wally_psbt_output_get_asset_surjectionproof_len(const struct wally_psbt_output *output, size_t *written)
```

Get the length of the asset surjection proof from an output.

Parameters

- **output** – The output to get from.
- **written** – Destination for the length, or zero if not present.

Returns See *Error Codes*

```
int wally_psbt_output_set_asset_surjectionproof(struct wally_psbt_output *output, const unsigned char *surjectionproof, size_t surjectionproof_len)
```

Set the asset surjection proof in an output.

Parameters

- **output** – The output to update.
- **surjectionproof** – The asset surjection proof.
- **surjectionproof_len** – Size of surjectionproof in bytes.

Returns See *Error Codes*

```
int wally_psbt_output_clear_asset_surjectionproof(struct wally_psbt_output *output)
```

Clear the asset surjection proof in an output.

Parameters

- **output** – The output to update.

Returns See *Error Codes*

```
int wally_psbt_output_get_blinding_public_key(const struct wally_psbt_output *output, unsigned char *bytes_out, size_t len, size_t *written)
```

Get the blinding public key from an output.

Parameters

- **output** – The output to get from.
- **bytes_out** – Destination for the blinding public key.
- **len** – Size of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_OUT_BLINDING_PUBKEY.

Returns See *Variable Length Output Buffers*

```
int wally_psbt_output_get_blinding_public_key_len(const struct wally_psbt_output *output,
                                                 size_t *written)
```

Get the length of the blinding public key from an output.

Parameters

- **output** – The output to get from.
- **written** – Destination for the length, or zero if not present.

Returns See *Error Codes*

```
int wally_psbt_output_set_blinding_public_key(struct wally_psbt_output *output, const unsigned char *pub_key, size_t pub_key_len)
```

Set the blinding public key in an output.

Parameters

- **output** – The output to update.
- **pub_key** – The blinding public key.
- **pub_key_len** – Size of pub_key in bytes.

Returns See *Error Codes*

```
int wally_psbt_output_clear_blinding_public_key(struct wally_psbt_output *output)
```

Clear the blinding public key in an output.

Parameters

- **output** – The output to update.

Returns See *Error Codes*

```
int wally_psbt_output_get_ecdh_public_key(const struct wally_psbt_output *output, unsigned char *bytes_out, size_t len, size_t *written)
```

Get the ephemeral ECDH public key from an output.

Parameters

- **output** – The output to get from.
- **bytes_out** – Destination for the ephemeral ECDH public key.
- **len** – Size of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_OUT_ECDH_PUBKEY.

Returns See *Variable Length Output Buffers*

```
int wally_psbt_output_get_ecdh_public_key_len(const struct wally_psbt_output *output,
                                              size_t *written)
```

Get the length of the ephemeral ECDH public key from an output.

Parameters

- **output** – The output to get from.
- **written** – Destination for the length, or zero if not present.

Returns See [Error Codes](#)

```
int wally_psbt_output_set_ecdh_public_key (struct wally_psbt_output *output, const unsigned char *pub_key, size_t pub_key_len)
```

Set the ephemeral ECDH public key in an output.

Parameters

- **output** – The output to update.
- **pub_key** – The ephemeral ECDH public key.
- **pub_key_len** – Size of pub_key in bytes.

Returns See [Error Codes](#)

```
int wally_psbt_output_clear_ecdh_public_key (struct wally_psbt_output *output)
```

Clear the ephemeral ECDH public key in an output.

Parameters

- **output** – The output to update.

Returns See [Error Codes](#)

```
int wally_psbt_output_get_value_blinding_rangeproof (const struct wally_psbt_output *output, unsigned char *bytes_out, size_t len, size_t *written)
```

Get the asset value blinding rangeproof from an output.

Parameters

- **output** – The output to get from.
- **bytes_out** – Destination for the asset value blinding rangeproof.
- **len** – Size of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_OUT_BLIND_VALUE_PROOF.

Returns See [Variable Length Output Buffers](#)

```
int wally_psbt_output_get_value_blinding_rangeproof_len (const struct wally_psbt_output *output, size_t *written)
```

Get the length of the asset value blinding rangeproof from an output.

Parameters

- **output** – The output to get from.
- **written** – Destination for the length, or zero if not present.

Returns See [Error Codes](#)

```
int wally_psbt_output_set_value_blinding_rangeproof(struct wally_psbt_output *output,
                                                    const unsigned char *rangeproof,
                                                    size_t rangeproof_len)
```

Set the asset value blinding rangeproof in an output.

Parameters

- **output** – The output to update.
- **rangeproof** – The asset value blinding rangeproof.
- **rangeproof_len** – Size of `rangeproof` in bytes.

Returns

 See [Error Codes](#)

```
int wally_psbt_output_clear_value_blinding_rangeproof(struct wally_psbt_output *output)
```

Clear the asset value blinding rangeproof in an output.

Parameters

- **output** – The output to update.

Returns

 See [Error Codes](#)

```
int wally_psbt_output_get_asset_blinding_surjectionproof(const struct
                                                       wally_psbt_output *output,
                                                       unsigned char *bytes_out,
                                                       size_t len, size_t *written)
```

Get the asset tag blinding surjection proof from an output.

Parameters

- **output** – The output to get from.
- **bytes_out** – Destination for the asset tag blinding surjection proof.
- **len** – Size of `bytes_out` in bytes.
- **written** – Destination for the number of bytes written to `bytes_out`. Will be zero if the value is not present.

Note: This operates on the PSET field PSBT_ELEMENTS_OUT_BLIND_ASSET_PROOF.

Returns

 See [Variable Length Output Buffers](#)

```
int wally_psbt_output_get_asset_blinding_surjectionproof_len(const struct
                                                               wally_psbt_output *output,
                                                               size_t *written)
```

Get the length of the asset tag blinding surjection proof from an output.

Parameters

- **output** – The output to get from.
- **written** – Destination for the length, or zero if not present.

Returns

 See [Error Codes](#)

```
int wally_psbt_output_set_asset_blinding_surjectionproof (struct
                                                       wally_psbt_output *output,
                                                       const unsigned char *sur-
                                                       jectionproof, size_t surjec-
                                                       tionproof_len)
```

Set the asset tag blinding surjection proof in an output.

Parameters

- **output** – The output to update.
- **surjectionproof** – The asset tag blinding surjection proof.
- **surjectionproof_len** – Size of **surjectionproof** in bytes.

Returns

See [Error Codes](#)

```
int wally_psbt_output_clear_asset_blinding_surjectionproof (struct
                                                       wally_psbt_output *out-
                                                       put)
```

Clear the asset tag blinding surjection proof in an output.

Parameters

- **output** – The output to update.

Returns

See [Error Codes](#)

```
int wally_psbt_output_get_blinding_status (const struct wally_psbt_output *output,
                                           uint32_t flags, size_t *written)
```

Get the blinding status of an output.

Parameters

- **output** – The output to get the blinding status from.
- **flags** – Flags controlling the checks to perform. Must be 0.
- **written** – Destination for the blinding status: WALLY_PSET_BLINDED_NONE if unblinded, WALLY_PSET_BLINDED_REQUIRED if only the blinding public key is present, WALLY_PSET_BLINDED_FULL or WALLY_PSET_BLINDED_PARTIAL if the blinding public key and all or only some blinding fields respectively are present.

Note: Returns WALLY_ERROR if the value or asset tag blinding key is invalid.

Returns

See [Error Codes](#)

```
int wally_psbt_init_alloc (uint32_t version, size_t inputs_allocation_len, size_t out-
                           puts_allocation_len, size_t global_unknowns_allocation_len,
                           uint32_t flags, struct wally_psbt **output)
```

Allocate and initialize a new PSBT.

Parameters

- **version** – The version of the PSBT. Must be WALLY_PSBT_VERSION_0 or WALLY_PSBT_VERSION_0.
- **inputs_allocation_len** – The number of inputs to pre-allocate space for.
- **outputs_allocation_len** – The number of outputs to pre-allocate space for.
- **global_unknowns_allocation_len** – The number of global unknowns to allocate space for.

- **flags** – Flags controlling psbt creation. Must be 0 or WALLY_PSBT_INIT_PSET.
- **output** – Destination for the resulting PSBT output.

Returns See *Error Codes*

```
int wally_psbt_free(struct wally_psbt *psbt)
```

Free a PSBT allocated by `wally_psbt_init_alloc`.

Parameters

- **psbt** – The PSBT to free.

Returns See *Error Codes*

```
int wally_psbt_set_version(struct wally_psbt *psbt, uint32_t flags, uint32_t version)
```

Set the version for a PSBT.

Parameters

- **psbt** – The PSBT to set the version for.
- **flags** – Flags controlling the version upgrade/downgrade. Must be 0.
- **version** – The version to use for the PSBT. Must be WALLY_PSBT_VERSION_0 or WALLY_PSBT_VERSION_2.

Note: This call converts the PSBT in place to the specified version.

Returns See *Error Codes*

```
int wally_psbt_get_id(const struct wally_psbt *psbt, uint32_t flags, unsigned char *bytes_out,
                      size_t len)
```

Return the BIP-370 unique id of a PSBT.

Parameters

- **psbt** – The PSBT to compute the id of.
- **flags** – **WALLY_PSBT_ID** flags to change the id calculation, or pass 0 to compute a BIP-370 compatible id.
- **bytes_out** – Destination for the id.
- **len** – Size of bytes_out in bytes. Must be WALLY_TXHASH_LEN.

Note: The id is expensive to compute.

Returns See *Error Codes*

```
int wally_psbt_get_locktime(const struct wally_psbt *psbt, size_t *written)
```

Return the calculated transaction lock time of a PSBT.

Parameters

- **psbt** – The PSBT to compute the lock time of. Must be a v2 PSBT.
- **written** – Destination for the calculated transaction lock time.

Note: The calculated lock time may change as the PSBT is modified.

Returns See [Error Codes](#)

```
int wally_psbt_is_finalized(const struct wally_psbt *psbt, size_t *written)
```

Determine if all PSBT inputs are finalized.

Parameters

- **psbt** – The PSBT to check.
- **written** – On success, set to one if the PSBT is finalized, otherwise zero.

Returns See [Error Codes](#)

```
int wally_psbt_set_global_tx(struct wally_psbt *psbt, const struct wally_tx *tx)
```

Set the global transaction for a PSBT.

Parameters

- **psbt** – The PSBT to set the transaction for.
- **tx** – The transaction to set.

The global transaction can only be set on a newly created version 0 PSBT. After this call completes the PSBT will have empty inputs and outputs for each input and output in the transaction **tx** given.

Returns See [Error Codes](#)

```
int wally_psbt_set_tx_version(struct wally_psbt *psbt, uint32_t tx_version)
```

Set the transaction version for a PSBT.

Parameters

- **psbt** – The PSBT to set the transaction version for. Must be a v2 PSBT.
- **version** – The version to use for the transaction. Must be at least 2.

Returns See [Error Codes](#)

```
int wally_psbt_get_tx_version(const struct wally_psbt *psbt, size_t *written)
```

Get the transaction version of a PSBT.

Parameters

- **psbt** – The PSBT to get the transaction version for. Must be v2 PSBT.
- **written** – Destination for the PSBT's transaction version.

Note: Returns the default version 2 if none has been explicitly set.

Returns See [Error Codes](#)

```
int wally_psbt_set_fallback_locktime(struct wally_psbt *psbt, uint32_t locktime)
```

Set the fallback locktime for a PSBT.

Parameters

- **psbt** – The PSBT to set the fallback locktime for.
- **locktime** – The fallback locktime to set.

Sets the fallback locktime field in the transaction. Cannot be set on V0 PSBTs.

Returns See [Error Codes](#)

```
int wally_psbt_clear_fallback_locktime(struct wally_psbt *psbt)
```

Clear the fallback locktime for a PSBT.

Parameters

- **psbt** – The PSBT to update.

Returns See [Error Codes](#)

```
int wally_psbt_set_tx_modifiable_flags(struct wally_psbt *psbt, uint32_t flags)
```

Set the transaction modifiable flags for a PSBT.

Parameters

- **psbt** – The PSBT to set the flags for.
- **flags** – **WALLY_PSBT_TXMOD_** flags indicating what can be modified.

Returns See [Error Codes](#)

```
int wally_psbt_set_global_scalars(struct wally_psbt *psbt, const struct wally_map *map_in)
```

Set the scalar offsets in a PSBT.

Parameters

- **psbt** – The psbt to update. Must be a PSET.
- **map_in** – The scalar offsets for this PSBT.

Returns See [Error Codes](#)

```
int wally_psbt_add_global_scalar(struct wally_psbt *psbt, const unsigned char *scalar,
```

size_t scalar_len)

Add a scalar offset to a PSBT.

Parameters

- **psbt** – The PSBT to add to. Must be a PSET.
- **scalar** – The scalar offset to add.
- **scalar_len** – The length of the scalar offset. Must be 32.

Returns See [Error Codes](#)

```
int wally_psbt_find_global_scalar(struct wally_psbt *psbt, const unsigned char *scalar,
```

size_t scalar_len, size_t *written)

Find a scalar offset in a PSBT.

Parameters

- **psbt** – The PSBT to find in. Must be a PSET.
- **scalar** – The scalar offset to find.
- **scalar_len** – The length of the scalar offset. Must be 32.
- **written** – On success, set to zero if the item is not found, otherwise the index of the item plus one.

Returns See [Error Codes](#)

```
int wally_psbt_set_pset_modifiable_flags(struct wally_psbt *psbt, uint32_t flags)
```

Set the Elements transaction modifiable flags for a PSBT.

Parameters

- **psbt** – The PSBT to set the flags for.
- **flags** – **PSBT_ELEMENTS_TX_MODIFIABLE_FLAGS_** flags indicating what can be modified.

Returns See [Error Codes](#)

```
int wally_psbt_add_tx_input_at (struct wally_psbt *psbt, uint32_t index, uint32_t flags, const struct  
                                wally_tx_input *input)
```

Add a transaction input to a PSBT at a given position.

Parameters

- **psbt** – The PSBT to add the input to.
- **index** – The zero-based index of the position to add the input at.
- **flags** – Flags controlling input insertion. Must be 0 or **WALLY_PSBT_FLAG_NON_FINAL**.
- **input** – The transaction input to add.

Returns See [Error Codes](#)

```
int wally_psbt_remove_input (struct wally_psbt *psbt, uint32_t index)
```

Remove a transaction input from a PSBT.

Parameters

- **psbt** – The PSBT to remove the input from.
- **index** – The zero-based index of the input to remove.

Returns See [Error Codes](#)

```
int wally_psbt_add_tx_output_at (struct wally_psbt *psbt, uint32_t index, uint32_t flags, const struct  
                                 wally_tx_output *output)
```

Add a transaction output to a PSBT at a given position.

Parameters

- **psbt** – The PSBT to add the output to.
- **index** – The zero-based index of the position to add the output at.
- **flags** – Flags controlling output insertion. Must be 0.
- **output** – The transaction output to add.

Returns See [Error Codes](#)

```
int wally_psbt_remove_output (struct wally_psbt *psbt, uint32_t index)
```

Remove a transaction output from a PSBT.

Parameters

- **psbt** – The PSBT to remove the output from.
- **index** – The zero-based index of the output to remove.

Returns See [Error Codes](#)

```
int wally_psbt_from_bytes (const unsigned char *bytes, size_t bytes_len, uint32_t flags, struct  
                           wally_psbt **output)
```

Create a PSBT from its serialized bytes.

Parameters

- **bytes** – Bytes to create the PSBT from.
- **bytes_len** – Length of **bytes** in bytes.
- **flags** – **WALLY_PSBT_PARSE_FLAG**_ flags controlling deserialization.
- **output** – Destination for the resulting PSBT.

Returns See *Error Codes*

```
int wally_psbt_get_length (const struct wally_psbt *psbt, uint32_t flags, size_t *written)
```

Get the length of a PSBT when serialized to bytes.

Parameters

- **psbt** – the PSBT.
- **flags** – Flags controlling length determination. Must be 0.
- **written** – Destination for the length in bytes when serialized.

Returns See *Error Codes*

```
int wally_psbt_to_bytes (const struct wally_psbt *psbt, uint32_t flags, unsigned char *bytes_out,  
                        size_t len, size_t *written)
```

Serialize a PSBT to bytes.

Parameters

- **psbt** – the PSBT to serialize.
- **flags** – Flags controlling serialization. Must be 0.
- **bytes_out** – Bytes to create the transaction from.
- **len** – Length of **bytes** in bytes (use *wally_psbt_get_length*).
- **written** – number of bytes written to **bytes_out**.

Returns See *Variable Length Output Buffers*

```
int wally_psbt_from_base64 (const char *base64, uint32_t flags, struct wally_psbt **output)
```

Create a PSBT from its serialized base64 string.

Parameters

- **base64** – Base64 string to create the PSBT from.
- **flags** – **WALLY_PSBT_PARSE_FLAG**_ flags controlling deserialization.
- **output** – Destination for the resulting PSBT.

Returns See *Error Codes*

```
int wally_psbt_to_base64 (const struct wally_psbt *psbt, uint32_t flags, char **output)
```

Serialize a PSBT to a base64 string.

Parameters

- **psbt** – the PSBT to serialize.
- **flags** – Flags controlling serialization. Must be 0.
- **output** – Destination for the resulting serialized PSBT.

Returns See *Error Codes*

```
int wally_psbt_combine (struct wally_psbt *psbt, const struct wally_psbt *source)
```

Combine the metadata from a source PSBT into another PSBT.

Parameters

- **psbt** – the PSBT to combine into.
- **source** – the PSBT to copy data from.

Returns See [Error Codes](#)

```
int wally_psbt_clone_alloc(const struct wally_psbt *psbt, uint32_t flags, struct wally_psbt **output)  
Clone a PSBT into a newly allocated copy.
```

Parameters

- **psbt** – the PSBT to clone.
- **flags** – Flags controlling PSBT creation. Must be 0.
- **output** – Destination for the resulting cloned PSBT.

Returns See [Error Codes](#)

```
int wally_psbt_blind(struct wally_psbt *psbt, const struct wally_map *values, const struct  
                      wally_map *vbfs, const struct wally_map *assets, const struct wally_map *abfs,  
                      const unsigned char *entropy, size_t entropy_len, uint32_t output_index,  
                      uint32_t flags, struct wally_map *output)
```

Blind a PSBT.

Parameters

- **psbt** – PSBT to blind. Directly modifies this PSBT.
- **values** – Integer map of input index to value for the callers inputs.
- **vbfs** – Integer map of input index to value blinding factor for the callers inputs.
- **assets** – Integer map of input index to asset tags for the callers inputs.
- **abfs** – Integer map of input index to asset blinding factors for the callers inputs.
- **entropy** – Random entropy for asset and blinding factor generation.
- **entropy_len** – Size of entropy in bytes. Must be a multiple of 5 * BLINDING_FACTOR_LEN for each non-fee output to be blinded, with an additional 2 * BLINDING_FACTOR_LEN bytes for any issuance outputs.
- **output_index** – The zero based index of the output to blind, or WALLY_PSET_BLIND_ALL.
- **flags** – Flags controlling blinding. Must be 0.
- **output** – Destination for a map of integer output index to the ephemeral private key used to blind the output. Ignored if NULL.

Returns See [Error Codes](#)

```
int wally_psbt_blind_alloc(struct wally_psbt *psbt, const struct wally_map *values, const  
                           struct wally_map *vbfs, const struct wally_map *assets, const struct  
                           wally_map *abfs, const unsigned char *entropy, size_t entropy_len,  
                           uint32_t output_index, uint32_t flags, struct wally_map **output)
```

Blind a PSBT.

As per [wally_psbt_blind](#), but allocates the output map.

Returns See [Error Codes](#)

```
int wally_psbt_sign(struct wally_psbt *psbt, const unsigned char *key, size_t key_len, uint32_t flags)  
Sign a PSBT using the simple signer algorithm.
```

Parameters

- **psbt** – PSBT to sign. Directly modifies this PSBT.
- **key** – Private key to sign PSBT with.
- **key_len** – Length of **key** in bytes. Must be EC_PRIVATE_KEY_LEN.
- **flags** – Flags controlling signing. Must be 0 or EC_FLAG_GRIND_R.

Note: See <https://github.com/bitcoin/bips/blob/master/bip-0174.mediawiki#simple-signer-algorithm> for a description of the simple signer algorithm.

Returns

 See *Error Codes*

```
int wally_psbt_finalize(struct wally_psbt *psbt)
```

Finalize a PSBT.

Parameters

- **psbt** – PSBT to finalize. Directly modifies this PSBT.

Returns

 See *Error Codes*

```
int wally_psbt_extract(const struct wally_psbt *psbt, struct wally_tx **output)
```

Extract a network transaction from a finalized PSBT.

Parameters

- **psbt** – PSBT to extract from.
- **output** – Destination for the resulting transaction.

Returns

 See *Error Codes*

```
int wally_psbt_is_elements(const struct wally_psbt *psbt, size_t *written)
```

Determine if a PSBT is an elements PSBT.

Parameters

- **psbt** – The PSBT to check.
- **written** – 1 if the PSBT is an elements PSBT, otherwise 0.

Returns

 See *Error Codes*

CHAPTER 9

Script Functions

```
int wally_scriptpubkey_get_type (const unsigned char *bytes, size_t bytes_len, size_t *written)  
Determine the type of a scriptPubkey script.
```

Parameters

- **bytes** – Bytes of the scriptPubkey.
- **bytes_len** – Length of bytes in bytes.
- **written** – Destination for the WALLY_SCRIPT_TYPE_ script type.

Returns

See [Error Codes](#)

```
int wally_scriptpubkey_p2pkh_from_bytes (const unsigned char *bytes, size_t bytes_len,  
                                         uint32_t flags, unsigned char *bytes_out, size_t len,  
                                         size_t *written)
```

Create a P2PKH scriptPubkey.

Parameters

- **bytes** – Bytes to create a scriptPubkey for.
- **bytes_len** – The length of bytes in bytes. If WALLY_SCRIPT_HASH160 is given in flags, bytes is a public key to hash160 before creating the P2PKH, and bytes_len must be EC_PUBLIC_KEY_LEN or EC_PUBLIC_KEY_UNCOMPRESSED_LEN. Otherwise, bytes_len must be HASH160_LEN and bytes must contain the hash160 to use.
- **flags** – WALLY_SCRIPT_HASH160 or 0.
- **bytes_out** – Destination for the resulting scriptPubkey.
- **len** – Length of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out.

Returns

See [Variable Length Output Buffers](#)

```
int wally_scriptsig_p2pkh_from_sig(const unsigned char *pub_key, size_t pub_key_len, const un-
                                signed char *sig, size_t sig_len, uint32_t sighash, unsigned
                                char *bytes_out, size_t len, size_t *written)
```

Create a P2PKH scriptSig from a pubkey and compact signature.

This function creates the scriptSig by converting `sig` to DER encoding, appending the given sighash, then calling `wally_scriptsig_p2pkh_from_der`.

Parameters

- **pub_key** – The public key to create a scriptSig with.
- **pub_key_len** – Length of `pub_key` in bytes. Must be `EC_PUBLIC_KEY_LEN` or `EC_PUBLIC_KEY_UNCOMPRESSED_LEN`.
- **sig** – The compact signature to create a scriptSig with.
- **sig_len** – The length of `sig` in bytes. Must be `EC_SIGNATURE_LEN`.
- **sighash** – `WALLY_SIGHASH_` flags specifying the type of signature desired.
- **bytes_out** – Destination for the resulting scriptSig.
- **len** – The length of `bytes_out` in bytes.
- **written** – Destination for the number of bytes written to `bytes_out`.

Returns

See [Variable Length Output Buffers](#)

```
int wally_witness_p2wpkh_from_sig(const unsigned char *pub_key, size_t pub_key_len, const un-
                                signed char *sig, size_t sig_len, uint32_t sighash, struct
                                wally_tx_witness_stack **witness)
```

Create a P2WPKH witness from a pubkey and compact signature.

Parameters

- **pub_key** – The public key to create a witness with.
- **pub_key_len** – Length of `pub_key` in bytes. Must be `EC_PUBLIC_KEY_LEN` or `EC_PUBLIC_KEY_UNCOMPRESSED_LEN`.
- **sig** – The compact signature to create a witness with.
- **sig_len** – The length of `sig` in bytes. Must be `EC_SIGNATURE_LEN`.
- **sighash** – `WALLY_SIGHASH_` flags specifying the type of signature desired.
- **witness** – Destination for the newly created witness.

Returns

See [Error Codes](#)

```
int wally_scriptsig_p2pkh_from_der(const unsigned char *pub_key, size_t pub_key_len, const un-
                                signed char *sig, size_t sig_len, unsigned char *bytes_out,
                                size_t len, size_t *written)
```

Create a P2PKH scriptSig from a pubkey and DER signature plus sighash.

Parameters

- **pub_key** – The public key to create a scriptSig with.
- **pub_key_len** – Length of `pub_key` in bytes. Must be `EC_PUBLIC_KEY_LEN` or `EC_PUBLIC_KEY_UNCOMPRESSED_LEN`.
- **sig** – The DER encoded signature to create a scriptSig, with the sighash byte appended to it.
- **sig_len** – The length of `sig` in bytes.

- **bytes_out** – Destination for the resulting scriptSig.
- **len** – The length of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out.

Returns See [Variable Length Output Buffers](#)

```
int wally_witness_p2wpkh_from_der(const unsigned char *pub_key, size_t pub_key_len,
                                   const unsigned char *sig, size_t sig_len, struct
                                   wally_tx_witness_stack **witness)
```

Create a P2WPKH witness from a pubkey and DER signature plus sighash.

Parameters

- **pub_key** – The public key to create a witness with.
- **pub_key_len** – Length of pub_key in bytes. Must be EC_PUBLIC_KEY_LEN EC_PUBLIC_KEY_UNCOMPRESSED_LEN.
- **sig** – The DER encoded signature to create a witness, with the sighash byte appended to it.
- **sig_len** – The length of sig in bytes.
- **witness** – Destination for the newly created witness.

Returns See [Error Codes](#)

```
int wally_scriptpubkey_op_return_from_bytes(const unsigned char *bytes, size_t bytes_len,
                                            uint32_t flags, unsigned char *bytes_out,
                                            size_t len, size_t *written)
```

Create an OP_RETURN scriptPubkey.

Parameters

- **bytes** – Bytes to create a scriptPubkey for.
- **bytes_len** – Length of bytes in bytes. Must be less than or equal to WALLY_MAX_OP_RETURN_LEN.
- **flags** – Currently unused, must be 0.
- **bytes_out** – Destination for the resulting scriptPubkey.
- **len** – The length of bytes_out in bytes. Passing WALLY_SCRIPTPUBKEY_OP_RETURN_MAX_LEN will ensure there is always enough room for the resulting scriptPubkey.
- **written** – Destination for the number of bytes written to bytes_out.

Returns See [Variable Length Output Buffers](#)

```
int wally_scriptpubkey_p2sh_from_bytes(const unsigned char *bytes, size_t bytes_len,
                                       uint32_t flags, unsigned char *bytes_out, size_t len,
                                       size_t *written)
```

Create a P2SH scriptPubkey.

Parameters

- **bytes** – Bytes to create a scriptPubkey for.
- **bytes_len** – Length of bytes in bytes.
- **flags** – WALLY_SCRIPT_HASH160 or 0.
- **bytes_out** – Destination for the resulting scriptPubkey.

- **len** – The length of `bytes_out` in bytes. If `WALLY_SCRIPT_HASH160` is given, `bytes` is a script to hash160 before creating the P2SH. Otherwise, `bytes_len` must be `HASH160_LEN` and `bytes` must contain the hash160 to use.
- **written** – Destination for the number of bytes written to `bytes_out`.

Returns See *Variable Length Output Buffers*

```
int wally_scriptpubkey_multisig_from_bytes(const unsigned char *bytes, size_t bytes_len,
                                            uint32_t threshold, uint32_t flags, unsigned
                                            char *bytes_out, size_t len, size_t *written)
```

Create a multisig scriptPubkey.

Parameters

- **bytes** – Compressed public keys to create a scriptPubkey from.
- **bytes_len** – Length of `bytes` in bytes. Must be a multiple of `EC_PUBLIC_KEY_LEN`.
- **threshold** – The number of signatures that must match to satisfy the script.
- **flags** – Must be `WALLY_SCRIPT_MULTISIG_SORTED` for BIP67 sorting or 0.
- **bytes_out** – Destination for the resulting scriptPubkey.
- **len** – The length of `bytes_out` in bytes.
- **written** – Destination for the number of bytes written to `bytes_out`.

Note: A maximum of 15 keys are allowed to be passed.

Returns See *Variable Length Output Buffers*

```
int wally_scriptsig_multisig_from_bytes(const unsigned char *script, size_t script_len,
                                         const unsigned char *bytes, size_t bytes_len, const
                                         uint32_t *sighash, size_t sighash_len, uint32_t flags,
                                         unsigned char *bytes_out, size_t len, size_t *written)
```

Create a multisig scriptSig.

Parameters

- **script** – The redeem script this scriptSig provides signatures for.
- **script_len** – The length of `script` in bytes.
- **bytes** – Compact signatures to place in the scriptSig.
- **bytes_len** – Length of `bytes` in bytes. Must be a multiple of `EC_SIGNATURE_LEN`.
- **sighash** – `WALLY_SIGHASH_` flags for each signature in `bytes`.
- **sighash_len** – The number of sighash flags in `sighash`.
- **flags** – Must be zero.
- **bytes_out** – Destination for the resulting scriptSig.
- **len** – The length of `bytes_out` in bytes.
- **written** – Destination for the number of bytes written to `bytes_out`.

Returns See *Variable Length Output Buffers*

```
int wally_witness_multisig_from_bytes(const unsigned char *script, size_t script_len,
                                      const unsigned char *bytes, size_t bytes_len, const
                                      uint32_t *sighash, size_t sighash_len, uint32_t flags,
                                      struct wally_tx_witness_stack **witness)
```

Create a multisig scriptWitness.

Parameters

- **script** – The witness script this scriptWitness provides signatures for.
- **script_len** – The length of **script** in bytes.
- **bytes** – Compact signatures to place in the scriptWitness.
- **bytes_len** – Length of **bytes** in bytes. Must be a multiple of EC_SIGNATURE_LEN.
- **sighash** – WALLY_SIGHASH_ flags for each signature in **bytes**.
- **sighash_len** – The number of sighash flags in **sighash**.
- **flags** – Must be zero.
- **witness** – Destination for newly allocated witness.

Returns See *Error Codes*

```
int wally_scriptpubkey_csv_2of2_then_1_from_bytes(const unsigned char *bytes,
                                                 size_t bytes_len, uint32_t csv_blocks,
                                                 uint32_t flags, unsigned
                                                 char *bytes_out, size_t len,
                                                 size_t *written)
```

Create a CSV 2of2 multisig with a single key recovery scriptPubkey.

The resulting output can be spent at any time with both of the two keys given, and by the last (recovery) key alone, **csv_blocks** after the output confirms.

Parameters

- **bytes** – Compressed public keys to create a scriptPubkey from. The second key given will be used as the recovery key.
- **bytes_len** – Length of **bytes** in bytes. Must 2 * EC_PUBLIC_KEY_LEN.
- **csv_blocks** – The number of blocks before the recovery key can be used. Must be between 17 and 65536.
- **flags** – Must be zero.
- **bytes_out** – Destination for the resulting scriptPubkey.
- **len** – The length of **bytes_out** in bytes.
- **written** – Destination for the number of bytes written to **bytes_out**.

Returns See *Variable Length Output Buffers*

```
int wally_scriptpubkey_csv_2of2_then_1_from_bytes_opt(const unsigned char *bytes,
                                                       size_t bytes_len,
                                                       uint32_t csv_blocks,
                                                       uint32_t flags, unsigned
                                                       char *bytes_out, size_t len,
                                                       size_t *written)
```

Create an optimised CSV 2of2 multisig with a single key recovery scriptPubkey.

Works like `wally_scriptpubkey_csv_2of2_then_1_from_bytes` but produces a script that is smaller and compatible with the miniscript expression “`and(pk(key_user),or(99@pk(key_service),older(<csv_blocks>)))`”.

Returns See [Variable Length Output Buffers](#)

```
int wally_scriptpubkey_csv_2of3_then_2_from_bytes (const unsigned char *bytes,
                                                size_t bytes_len, uint32_t csv_blocks,
                                                uint32_t flags, unsigned
                                                char *bytes_out, size_t len,
                                                size_t *written)
```

Create a CSV 2of3 multisig with two key recovery scriptPubkey.

The resulting output can be spent at any time with any two of the three keys given, and by either of the last two (recovery) keys alone, `csv_blocks` after the output confirms.

Parameters

- **bytes** – Compressed public keys to create a scriptPubkey from. The second and third keys given will be used as the recovery keys.
- **bytes_len** – Length of `bytes` in bytes. Must `3 * EC_PUBLIC_KEY_LEN`.
- **csv_blocks** – The number of blocks before the recovery keys can be used. Must be between 17 and 65536.
- **flags** – Must be zero.
- **bytes_out** – Destination for the resulting scriptPubkey.
- **len** – The length of `bytes_out` in bytes.
- **written** – Destination for the number of bytes written to `bytes_out`.

Returns See [Variable Length Output Buffers](#)

```
int wally_script_push_from_bytes (const unsigned char *bytes, size_t bytes_len, uint32_t flags, un-
                                  signed char *bytes_out, size_t len, size_t *written)
```

Create a bitcoin script that pushes data to the stack.

Parameters

- **bytes** – Bytes to create a push script for.
- **bytes_len** – Length of `bytes` in bytes.
- **flags** – `WALLY_SCRIPT_HASH160` or `WALLY_SCRIPT_SHA256` to hash `bytes` before pushing it.
- **bytes_out** – Destination for the resulting push script.
- **len** – The length of `bytes_out` in bytes.
- **written** – Destination for the number of bytes written to `bytes_out`.

Returns See [Variable Length Output Buffers](#)

```
int wally_varint_get_length (uint64_t value, size_t *written)
```

Get the length of an integer serialized to a varint.

Parameters

- **value** – The integer value to be find the length of.
- **written** – Destination for the length of the integer when serialized.

Returns See [Error Codes](#)

```
int wally_varint_to_bytes (uint64_t value, unsigned char *bytes_out, size_t len, size_t *written)
```

Serialize an integer to a buffer as a varint.

Parameters

- **value** – The integer value to be serialized.
- **bytes_out** – Destination for the resulting serialized varint.
- **len** – The length of bytes_out in bytes. Must be at least wally_varint_get_length(value).
- **written** – Destination for the number of bytes written to bytes_out.

Returns

See [Variable Length Output Buffers](#)

```
int wally_varbuff_get_length (const unsigned char *bytes, size_t bytes_len, size_t *written)
```

Get the length of a buffer serialized to a varbuff (varint size, followed by the buffer).

Parameters

- **bytes** – The buffer to get the length of.
- **bytes_len** – Length of bytes in bytes.
- **written** – Destination for the length of the buffer when serialized.

Returns

See [Error Codes](#)

```
int wally_varbuff_to_bytes (const unsigned char *bytes, size_t bytes_len, unsigned char *bytes_out,
```

```
                           size_t len, size_t *written)
```

Serialize a buffer to a varbuff (varint size, followed by the buffer).

Parameters

- **bytes** – The buffer to be serialized.
- **bytes_len** – Length of bytes in bytes.
- **bytes_out** – Destination for the resulting serialized varbuff.
- **len** – The length of bytes_out in bytes. Must be at least wally_varbuff_get_length(bytes, bytes_len).
- **written** – Destination for the number of bytes written to bytes_out.

Returns

See [Variable Length Output Buffers](#)

```
int wally_witness_program_from_bytes (const unsigned char *bytes, size_t bytes_len,
```

```
                                     uint32_t flags, unsigned char *bytes_out, size_t len,
```

```
                                     size_t *written)
```

Create a segwit witness program from a script or hash.

Parameters

- **bytes** – Script or hash bytes to create a witness program from.
- **bytes_len** – Length of bytes in bytes. Must be HASH160_LEN or SHA256_LEN if neither WALLY_SCRIPT_HASH160 or WALLY_SCRIPT_SHA256 is given.
- **flags** – WALLY_SCRIPT_HASH160 or WALLY_SCRIPT_SHA256 to hash the input script before using it. WALLY_SCRIPT_AS_PUSH to generate a push of the generated script as used for the scriptSig in p2sh-p2wpkh and p2sh-p2wsh.
- **bytes_out** – Destination for the resulting witness program.
- **len** – The length of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out.

Returns See *Variable Length Output Buffers*

```
int wally_witness_program_from_bytes_and_version(const unsigned char *bytes,
                                                size_t bytes_len, uint32_t version,
                                                uint32_t flags, unsigned char *bytes_out,
                                                size_t len, size_t *written)
```

Create a segwit witness program from a script or hash using witness version.

Parameters

- **bytes** – Script or hash bytes to create a witness program from.
- **bytes_len** – Length of **bytes** in bytes.
- **version** – Witness version to create a witness program from. Specify a value of 16 or less.
- **flags** – WALLY_SCRIPT_HASH160 or WALLY_SCRIPT_SHA256 to hash the input script before using it. WALLY_SCRIPT_AS_PUSH to generate a push of the generated script as used for the scriptSig in p2sh-p2wpkh and p2sh-p2wsh.
- **bytes_out** – Destination for the resulting witness program.
- **len** – The length of **bytes_out** in bytes.
- **written** – Destination for the number of bytes written to **bytes_out**.

Returns See *Variable Length Output Buffers*

```
int wally_elements_pegout_script_size(size_t genesis_blockhash_len, size_t main-
                                         chain_script_len, size_t sub_pubkey_len,
                                         size_t whitelistproof_len, size_t *written)
```

Get the pegout script size.

Parameters

- **genesis_blockhash_len** – Length of **genesis_blockhash** in bytes. Must be SHA256_LEN.
- **mainchain_script_len** – Length of **mainchain_script** in bytes.
- **sub_pubkey_len** – Length of **sub_pubkey** in bytes. Must be EC_PUBLIC_KEY_LEN.
- **whitelistproof_len** – The length of **whitelistproof** in bytes.
- **written** – Destination for the number of bytes required to hold the pegout script.

Returns See *Error Codes*

```
int wally_elements_pegout_script_from_bytes(const unsigned char *genesis_blockhash,
                                             size_t genesis_blockhash_len, const
                                             unsigned char *mainchain_script,
                                             size_t mainchain_script_len, const unsigned
                                             char *sub_pubkey, size_t sub_pubkey_len,
                                             const unsigned char *whitelistproof,
                                             size_t whitelistproof_len, uint32_t flags, un-
                                             signed char *bytes_out, size_t len, size_t *written)
```

Create a pegout script.

Parameters

- **genesis_blockhash** – The genesis blockhash of the parent chain.

- **genesis_blockhash_len** – Length of genesis_blockhash in bytes. Must be SHA256_LEN.
- **mainchain_script** – The parent chain script.
- **mainchain_script_len** – Length of mainchain_script in bytes.
- **sub_pubkey** – The whitelisted public key.
- **sub_pubkey_len** – Length of sub_pubkey in bytes. Must be EC_PUBLIC_KEY_LEN.
- **whitelistproof** – The whitelist proof.
- **whitelistproof_len** – The length of whitelistproof in bytes.
- **flags** – Must be zero.
- **bytes_out** – Destination for the resulting pegout script.
- **len** – The length of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out.

Returns See *Variable Length Output Buffers*

```
int wally_elements_pegin_contract_script_from_bytes(const unsigned char *redeem_script, size_t redeem_script_len, const unsigned char *script, size_t script_len, uint32_t flags, unsigned char *bytes_out, size_t len, size_t *written)
```

Create a script for P2CH pegin transactions.

Parameters

- **redeem_script** – The federation redeem script.
- **redeem_script_len** – Length of redeem_script in bytes.
- **script** – The claim script.
- **script_len** – Length of script in bytes.
- **flags** – Must be zero.
- **bytes_out** – Destination for the resulting script.
- **len** – Length of bytes_out in bytes.
- **written** – Destination for the number of bytes written to bytes_out.

Returns See *Variable Length Output Buffers*

CHAPTER 10

Symmetric Functions

```
int wally_symmetric_key_from_seed(const unsigned char *bytes, size_t bytes_len, unsigned char *bytes_out, size_t len)
```

Create a new symmetric parent key from entropy.

Parameters

- **bytes** – Entropy to use.
- **bytes_len** – Size of bytes in bytes. Must be one of BIP32_ENTROPY_LEN_128, BIP32_ENTROPY_LEN_256 or BIP32_ENTROPY_LEN_512.
- **bytes_out** – Destination for the resulting parent key.
- **len** – Size of bytes_out in bytes. Must be HMAC_SHA512_LEN.

Returns

See [Error Codes](#)

```
int wally_symmetric_key_from_parent(const unsigned char *bytes, size_t bytes_len, uint32_t version, const unsigned char *label, size_t label_len, unsigned char *bytes_out, size_t len)
```

Create a new child symmetric key from a parent key.

Parameters

- **bytes** – Parent key to use.
- **bytes_len** – Size of bytes in bytes. Must be HMAC_SHA512_LEN.
- **version** – Version byte to prepend to label. Must be zero.
- **label** – Label to use for the child.
- **label_len** – Size of label in bytes.
- **bytes_out** – Destination for the resulting key.
- **len** – Size of bytes_out in bytes. Must be HMAC_SHA512_LEN.

Returns

See [Error Codes](#)

CHAPTER 11

Transaction Functions

```
int wally_tx_witness_stack_init_alloc(size_t allocation_len, struct  
wally_tx_witness_stack **output)
```

Allocate and initialize a new witness stack.

Parameters

- **allocation_len** – The number of items to pre-allocate space for.
- **output** – Destination for the resulting witness stack.

Returns

 See [Error Codes](#)

```
int wally_tx_witness_stack_clone_alloc(const struct wally_tx_witness_stack *stack, struct  
wally_tx_witness_stack **output)
```

Create a copy of a witness stack.

Parameters

- **stack** – The witness stack to copy.
- **output** – Destination for the resulting copy.

Returns

 See [Error Codes](#)

```
int wally_tx_witness_stack_add(struct wally_tx_witness_stack *stack, const unsigned char *witness,  
size_t witness_len)
```

Add a witness to a witness stack.

Parameters

- **stack** – The witness stack to add to.
- **witness** – The witness data to add to the stack.
- **witness_len** – Length of witness in bytes.

Returns

 See [Error Codes](#)

```
int wally_tx_witness_stack_add_dummy(struct wally_tx_witness_stack *stack, uint32_t flags)
```

Add a dummy witness item to a witness stack.

Parameters

- **stack** – The witness stack to add to.
- **flags** – WALLY_TX_DUMMY_ Flags indicating the type of dummy to add.

Returns See [Error Codes](#)

```
int wally_tx_witness_stack_set (struct wally_tx_witness_stack *stack, size_t index, const unsigned char *witness, size_t witness_len)
```

Set a witness item to a witness stack.

Parameters

- **stack** – The witness stack to add to.
- **index** – Index of the item to set. The stack will grow if needed to this many items.
- **witness** – The witness data to add to the stack.
- **witness_len** – Length of witness in bytes.

Returns See [Error Codes](#)

```
int wally_tx_witness_stack_set_dummy (struct wally_tx_witness_stack *stack, size_t index, uint32_t flags)
```

Set a dummy witness item to a witness stack.

Parameters

- **stack** – The witness stack to add to.
- **index** – Index of the item to set. The stack will grow if needed to this many items.
- **flags** – WALLY_TX_DUMMY_ Flags indicating the type of dummy to set.

Returns See [Error Codes](#)

```
int wally_tx_witness_stack_free (struct wally_tx_witness_stack *stack)
```

Free a transaction witness stack allocated by [wally_tx_witness_stack_init_alloc](#).

Parameters

- **stack** – The transaction witness stack to free.

Returns See [Error Codes](#)

```
int wally_tx_input_init_alloc (const unsigned char *txhash, size_t txhash_len, uint32_t utxo_index, uint32_t sequence, const unsigned char *script, size_t script_len, const struct wally_tx_witness_stack *witness, struct wally_tx_input **output)
```

Allocate and initialize a new transaction input.

Parameters

- **txhash** – The transaction hash of the transaction this input comes from.
- **txhash_len** – Size of txhash in bytes. Must be WALLY_TXHASH_LEN.
- **utxo_index** – The zero-based index of the transaction output in txhash that this input comes from.
- **sequence** – The sequence number for the input.
- **script** – The scriptSig for the input.
- **script_len** – Size of script in bytes.
- **witness** – The witness stack for the input, or NULL if no witness is present.

- **output** – Destination for the resulting transaction input.

Returns See *Error Codes*

```
int wally_tx_input_free (struct wally_tx_input *input)  
Free a transaction input allocated by wally\_tx\_input\_init\_alloc.
```

Parameters

- **input** – The transaction input to free.

Returns See *Error Codes*

```
int wally_tx_output_init (uint64_t satoshi, const unsigned char *script, size_t script_len, struct  
                           wally_tx_output *output)  
Initialize a new transaction output.
```

:param satoshi The amount of the output in satoshi. :param script: The scriptPubkey for the output. :param script_len: Size of script in bytes. :param output: Transaction output to initialize.

Returns See *Error Codes*

```
int wally_tx_output_init_alloc (uint64_t satoshi, const unsigned char *script, size_t script_len,  
                               struct wally_tx_output **output)  
Allocate and initialize a new transaction output.
```

:param satoshi The amount of the output in satoshi. :param script: The scriptPubkey for the output. :param script_len: Size of script in bytes. :param output: Destination for the resulting transaction output.

Returns See *Error Codes*

```
int wally_tx_output_clone_alloc (const struct wally_tx_output *tx_output_in, struct  
                                 wally_tx_output **output)  
Create a new copy of a transaction output.
```

Parameters

- **tx_output_in** – The transaction output to clone.
- **output** – Destination for the resulting transaction output copy.

Returns See *Error Codes*

```
int wally_tx_output_clone (const struct wally_tx_output *tx_output_in, struct wally_tx_output *out-  
                           put)  
Create a new copy of a transaction output in place.
```

Parameters

- **tx_output_in** – The transaction output to clone.
- **output** – Destination for the resulting transaction output copy.

Note: `output` is overwritten in place, and not cleared first.

Returns See *Error Codes*

```
int wally_tx_output_free (struct wally_tx_output *output)  
Free a transaction output allocated by wally\_tx\_output\_init\_alloc.
```

Parameters

- **output** – The transaction output to free.

Returns See *Error Codes*

```
int wally_tx_init_alloc(uint32_t version, uint32_t locktime, size_t inputs_allocation_len, size_t outputs_allocation_len, struct wally_tx **output)
```

Allocate and initialize a new transaction.

Parameters

- **version** – The version of the transaction.
- **locktime** – The locktime of the transaction.
- **inputs_allocation_len** – The number of inputs to pre-allocate space for.
- **outputs_allocation_len** – The number of outputs to pre-allocate space for.
- **output** – Destination for the resulting transaction output.

Returns See [Error Codes](#)

```
int wally_tx_clone_alloc(const struct wally_tx *tx, uint32_t flags, struct wally_tx **output)
```

Create a new copy of a transaction.

Parameters

- **tx** – The transaction to clone.
- **flags** – Flags controlling transaction creation. Must be 0.
- **output** – Destination for the resulting transaction copy.

Returns See [Error Codes](#)

```
int wally_tx_add_input(struct wally_tx *tx, const struct wally_tx_input *input)
```

Add a transaction input to a transaction.

Parameters

- **tx** – The transaction to add the input to.
- **input** – The transaction input to add to tx.

Returns See [Error Codes](#)

```
int wally_tx_add_input_at(struct wally_tx *tx, uint32_t index, const struct wally_tx_input *input)
```

Add a transaction input to a transaction at a given position.

Parameters

- **tx** – The transaction to add the input to.
- **index** – The zero-based index of the position to add the input at.
- **input** – The transaction input to add to tx.

Returns See [Error Codes](#)

```
int wally_tx_add_raw_input(struct wally_tx *tx, const unsigned char *txhash, size_t txhash_len,  
                           uint32_t utxo_index, uint32_t sequence, const unsigned char *script,  
                           size_t script_len, const struct wally_tx_witness_stack *witness,  
                           uint32_t flags)
```

Add a transaction input to a transaction.

Parameters

- **tx** – The transaction to add the input to.
- **txhash** – The transaction hash of the transaction this input comes from.
- **txhash_len** – Size of txhash in bytes. Must be WALLY_TXHASH_LEN.

- **utxo_index** – The zero-based index of the transaction output in txhash that this input comes from.
- **sequence** – The sequence number for the input.
- **script** – The scriptSig for the input.
- **script_len** – Size of script in bytes.
- **witness** – The witness stack for the input, or NULL if no witness is present.
- **flags** – Flags controlling input creation. Must be 0.

Returns See [Error Codes](#)

```
int wally_tx_add_raw_input_at(struct wally_tx *tx, uint32_t index, const unsigned char *tx-
    hash, size_t txhash_len, uint32_t utxo_index, uint32_t sequence,
    const unsigned char *script, size_t script_len, const struct
    wally_tx_witness_stack *witness, uint32_t flags)
```

Add a transaction input to a transaction in a given position.

Parameters

- **tx** – The transaction to add the input to.
- **index** – The zero-based index of the position to add the input at.
- **txhash** – The transaction hash of the transaction this input comes from.
- **txhash_len** – Size of txhash in bytes. Must be WALLY_TXHASH_LEN.
- **utxo_index** – The zero-based index of the transaction output in txhash that this input comes from.
- **sequence** – The sequence number for the input.
- **script** – The scriptSig for the input.
- **script_len** – Size of script in bytes.
- **witness** – The witness stack for the input, or NULL if no witness is present.
- **flags** – Flags controlling input creation. Must be 0.

Returns See [Error Codes](#)

```
int wally_tx_remove_input(struct wally_tx *tx, size_t index)
```

Remove a transaction input from a transaction.

Parameters

- **tx** – The transaction to remove the input from.
- **index** – The zero-based index of the input to remove.

Returns See [Error Codes](#)

```
int wally_tx_set_input_script(const struct wally_tx *tx, size_t index, const unsigned char *script,
    size_t script_len)
```

Set the scriptsig for an input in a transaction.

Parameters

- **tx** – The transaction to operate on.
- **index** – The zero-based index of the input to set the script on.
- **script** – The scriptSig for the input.

- **script_len** – Size of script in bytes.

Returns See *Error Codes*

```
int wally_tx_set_input_witness (const struct wally_tx *tx, size_t index, const struct wally_tx_witness_stack *stack)
```

Set the witness stack for an input in a transaction.

Parameters

- **tx** – The transaction to operate on.
- **index** – The zero-based index of the input to set the witness stack on.
- **stack** – The transaction witness stack to set.

Returns See *Error Codes*

```
int wally_tx_add_output (struct wally_tx *tx, const struct wally_tx_output *output)
```

Add a transaction output to a transaction.

Parameters

- **tx** – The transaction to add the output to.
- **output** – The transaction output to add to tx.

Returns See *Error Codes*

```
int wally_tx_add_output_at (struct wally_tx *tx, uint32_t index, const struct wally_tx_output *output)
```

Add a transaction output to a transaction at a given position.

Parameters

- **tx** – The transaction to add the output to.
- **index** – The zero-based index of the position to add the output at.
- **output** – The transaction output to add to tx.

Returns See *Error Codes*

```
int wally_tx_add_raw_output (struct wally_tx *tx, uint64_t satoshi, const unsigned char *script, size_t script_len, uint32_t flags)
```

Add a transaction output to a transaction.

Parameters

- **tx** – The transaction to add the output to.
- **satoshi** – The amount of the output in satoshi.
- **script** – The scriptPubkey for the output.
- **script_len** – Size of script in bytes.
- **flags** – Flags controlling output creation. Must be 0.

Returns See *Error Codes*

```
int wally_tx_add_raw_output_at (struct wally_tx *tx, uint32_t index, uint64_t satoshi, const unsigned char *script, size_t script_len, uint32_t flags)
```

Add a transaction output to a transaction at a given position.

Parameters

- **tx** – The transaction to add the output to.
- **index** – The zero-based index of the position to add the output at.

- **satoshi** – The amount of the output in satoshi.
- **script** – The scriptPubkey for the output.
- **script_len** – Size of `script` in bytes.
- **flags** – Flags controlling output creation. Must be 0.

Returns See [Error Codes](#)

```
int wally_tx_remove_output (struct wally_tx *tx, size_t index)
```

Remove a transaction output from a transaction.

Parameters

- **tx** – The transaction to remove the output from.
- **index** – The zero-based index of the output to remove.

Returns See [Error Codes](#)

```
int wally_tx_get_witness_count (const struct wally_tx *tx, size_t *written)
```

Get the number of inputs in a transaction that have witness data.

Parameters

- **tx** – The transaction to get the witnesses count from.
- **written** – Destination for the number of witness-containing inputs.

Returns See [Error Codes](#)

```
int wally_tx_free (struct wally_tx *tx)
```

Free a transaction allocated by `wally_tx_init_alloc`.

Parameters

- **tx** – The transaction to free.

Returns See [Error Codes](#)

```
int wally_tx_get_txid (const struct wally_tx *tx, unsigned char *bytes_out, size_t len)
```

Return the txid of a transaction.

Parameters

- **tx** – The transaction to compute the txid of.
- **bytes_out** – Destination for the txid.
- **len** – Size of `bytes_out` in bytes. Must be `WALLY_TXHASH_LEN`.

Note: The txid is expensive to compute.

Returns See [Error Codes](#)

```
int wally_tx_get_length (const struct wally_tx *tx, uint32_t flags, size_t *written)
```

Return the length of transaction once serialized into bytes.

Parameters

- **tx** – The transaction to find the serialized length of.
- **flags** – `WALLY_TX_FLAG_` Flags controlling serialization options.
- **written** – Destination for the length of the serialized bytes.

Returns See [Error Codes](#)

```
int wally_tx_from_bytes(const unsigned char *bytes, size_t bytes_len, uint32_t flags, struct  
                        wally_tx **output)
```

Create a transaction from its serialized bytes.

Parameters

- **bytes** – Bytes to create the transaction from.
- **bytes_len** – Length of bytes in bytes.
- **flags** – WALLY_TX_FLAG_ Flags controlling serialization options.
- **output** – Destination for the resulting transaction.

Returns See [Error Codes](#)

```
int wally_tx_from_hex(const char *hex, uint32_t flags, struct wally_tx **output)
```

Create a transaction from its serialized bytes in hexadecimal.

Parameters

- **hex** – Hexadecimal string containing the transaction.
- **flags** – WALLY_TX_FLAG_ Flags controlling serialization options.
- **output** – Destination for the resulting transaction.

Returns See [Error Codes](#)

```
int wally_tx_to_bytes(const struct wally_tx *tx, uint32_t flags, unsigned char *bytes_out, size_t len,  
                      size_t *written)
```

Serialize a transaction to bytes.

Parameters

- **tx** – The transaction to serialize.
- **flags** – WALLY_TX_FLAG_ Flags controlling serialization options.
- **bytes_out** – Destination for the serialized transaction.
- **len** – Size of bytes_out in bytes.
- **written** – Destination for the length of the serialized transaction.

Returns See [Variable Length Output Buffers](#)

```
int wally_tx_to_hex(const struct wally_tx *tx, uint32_t flags, char **output)
```

Serialize a transaction to hex.

Parameters

- **tx** – The transaction to serialize.
- **flags** – WALLY_TX_FLAG_ Flags controlling serialization options.
- **output** – Destination for the resulting hexadecimal string.

Note: The string returned should be freed using [wally_free_string](#).

Returns See [Error Codes](#)

```
int wally_tx_get_weight(const struct wally_tx *tx, size_t *written)
```

Get the weight of a transaction.

Parameters

- **tx** – The transaction to get the weight of.
- **written** – Destination for the weight.

Returns See *Error Codes*

```
int wally_tx_get_vsize(const struct wally_tx *tx, size_t *written)
```

Get the virtual size of a transaction.

Parameters

- **tx** – The transaction to get the virtual size of.
- **written** – Destination for the virtual size.

Returns See *Error Codes*

```
int wally_tx_vsize_from_weight(size_t weight, size_t *written)
```

Compute transaction vsize from transaction weight.

Parameters

- **weight** – The weight to convert to a virtual size.
- **written** – Destination for the virtual size.

Returns See *Error Codes*

```
int wally_tx_get_total_output_satoshi(const struct wally_tx *tx, uint64_t *value_out)
```

Compute the total sum of all outputs in a transaction.

Parameters

- **tx** – The transaction to compute the total from.
- **value_out** – Destination for the output total.

Returns See *Error Codes*

```
int wally_tx_get_btc_signature_hash(const struct wally_tx *tx, size_t index, const unsigned char *script, size_t script_len, uint64_t satoshi, uint32_t sighash, uint32_t flags, unsigned char *bytes_out, size_t len)
```

Create a BTC transaction for signing and return its hash.

Parameters

- **tx** – The transaction to generate the signature hash from.
- **index** – The input index of the input being signed for.
- **script** – The (unprefixed) scriptCode for the input being signed.
- **script_len** – Size of **script** in bytes.
- **satoshi** – The amount spent by the input being signed for. Only used if flags includes **WALLY_TX_FLAG_USE_WITNESS**, pass 0 otherwise.
- **sighash** – **WALLY_SIGHASH_** flags specifying the type of signature desired.
- **flags** – **WALLY_TX_FLAG_USE_WITNESS** to generate a BIP 143 signature, or 0 to generate a pre-segwit Bitcoin signature.
- **bytes_out** – Destination for the signature hash.
- **len** – Size of **bytes_out** in bytes. Must be at least **SHA256_LEN**.

Returns See [Error Codes](#)

```
int wally_tx_get_signature_hash(const struct wally_tx *tx, size_t index, const unsigned char *script,
                                size_t script_len, const unsigned char *extra, size_t extra_len,
                                uint32_t extra_offset, uint64_t satoshi, uint32_t sighash,
                                uint32_t tx_sighash, uint32_t flags, unsigned char *bytes_out,
                                size_t len)
```

Create a transaction for signing and return its hash.

Parameters

- **tx** – The transaction to generate the signature hash from.
- **index** – The input index of the input being signed for.
- **script** – The (unprefixed) scriptCode for the input being signed.
- **script_len** – Size of **script** in bytes.
- **extra** – Extra bytes to include in the transaction preimage.
- **extra_len** – Size of **extra** in bytes.
- **extra_offset** – Offset with the preimage to store **extra**. To store it at the end of the preimage, use 0xffffffff.
- **satoshi** – The amount spent by the input being signed for. Only used if flags includes WALLY_TX_FLAG_USE_WITNESS, pass 0 otherwise.
- **sighash** – WALLY_SIGHASH_ flags specifying the type of signature desired.
- **tx_sighash** – The 32bit sighash value to include in the preimage to hash. This must be given in host CPU endianess; For normal Bitcoin signing the value of **sighash** should be given.
- **flags** – WALLY_TX_FLAG_USE_WITNESS to generate a BIP 143 signature, or 0 to generate a pre-segwit Bitcoin signature.
- **bytes_out** – Destination for the signature hash.
- **len** – Size of **bytes_out** in bytes. Must be at least SHA256_LEN.

Returns See [Error Codes](#)

```
int wally_tx_is_coinbase(const struct wally_tx *tx, size_t *written)
```

Determine if a transaction is a coinbase transaction.

Parameters

- **tx** – The transaction to check.
- **written** – 1 if the transaction is a coinbase transaction, otherwise 0.

Returns See [Error Codes](#)

```
int wally_tx_elements_input_issuance_set(struct wally_tx_input *input, const unsigned
                                         char *nonce, size_t nonce_len, const unsigned
                                         char *entropy, size_t entropy_len, const
                                         unsigned char *issuance_amount, size_t issuance_amount_len,
                                         const unsigned char *inflation_keys, size_t inflation_keys_len, const
                                         unsigned char *issuance_amount_rangeproof, size_t issuance_amount_rangeproof_len,
                                         const unsigned char *inflation_keys_rangeproof, size_t inflation_keys_rangeproof_len)
```

Set issuance data on an input.

Parameters

- **input** – The input to add to.
- **nonce** – Asset issuance or revelation blinding factor.
- **nonce_len** – Size of nonce in bytes. Must be WALLY_TX_ASSET_TAG_LEN.
- **entropy** – Entropy for the asset tag calculation.
- **entropy_len** – Size of entropy in bytes. Must be WALLY_TX_ASSET_TAG_LEN.
- **issuance_amount** – The (blinded) issuance amount.
- **issuance_amount_len** – Size of issuance_amount in bytes.
- **inflation_keys** – The (blinded) token reissuance amount.
- **inflation_keys_len** – Size of inflation_keys in bytes.
- **issuance_amount_rangeproof** – Issuance amount rangeproof.
- **issuance_amount_rangeproof_len** – Size of issuance_amount_rangeproof in bytes.
- **inflation_keys_rangeproof** – Inflation keys rangeproof.
- **inflation_keys_rangeproof_len** – Size of inflation_keys_rangeproof in bytes.

Returns See *Error Codes*

```
int wally_tx_elements_input_issuance_free(struct wally_tx_input *input)
```

Free issuance data on an input.

Parameters

- **input** – The input issuance data to free.

Returns See *Error Codes*

```
int wally_tx_elements_input_init_alloc(const unsigned char *txhash, size_t txhash_len,
                                      uint32_t utxo_index, uint32_t sequence, const unsigned char *script, size_t script_len, const struct wally_tx_witness_stack *witness, const unsigned char *nonce, size_t nonce_len, const unsigned char *entropy, size_t entropy_len, const unsigned char *issuance_amount, size_t issuance_amount_len, const unsigned char *inflation_keys, size_t inflation_keys_len, const unsigned char *issuance_amount_rangeproof, size_t issuance_amount_rangeproof_len, const unsigned char *inflation_keys_rangeproof, size_t inflation_keys_rangeproof_len, const struct wally_tx_witness_stack *pegin_witness, struct wally_tx_input **output)
```

Allocate and initialize a new elements transaction input.

Parameters

- **txhash** – The transaction hash of the transaction this input comes from.
- **txhash_len** – Size of txhash in bytes. Must be WALLY_TXHASH_LEN.

- **utxo_index** – The zero-based index of the transaction output in txhash that this input comes from.
- **sequence** – The sequence number for the input.
- **script** – The scriptSig for the input.
- **script_len** – Size of script in bytes.
- **witness** – The witness stack for the input, or NULL if no witness is present.
- **nonce** – Asset issuance or revelation blinding factor.
- **nonce_len** – Size of nonce in bytes. Must be WALLY_TX_ASSET_TAG_LEN.
- **entropy** – Entropy for the asset tag calculation.
- **entropy_len** – Size of entropy in bytes. Must be WALLY_TX_ASSET_TAG_LEN.
- **issuance_amount** – The (blinded) issuance amount.
- **issuance_amount_len** – Size of issuance_amount in bytes.
- **inflation_keys** – The (blinded) token reissuance amount.
- **inflation_keys_len** – Size of inflation_keys in bytes.
- **issuance_amount_rangeproof** – Issuance amount rangeproof.
• **issuance_amount_rangeproof_len** – Size of issuance_amount_rangeproof in bytes.
- **inflation_keys_rangeproof** – Inflation keys rangeproof.
- **inflation_keys_rangeproof_len** – Size of inflation_keys_rangeproof in bytes.
- **pegin_witness** – The pegin witness stack for the input, or NULL if no witness is present.
- **output** – Destination for the resulting transaction input.

Returns See [Error Codes](#)

```
int wally_tx_elements_input_is_pegin(const struct wally_tx_input *input, size_t *written)
```

Determine if an input is a pegin.

Parameters

- **input** – The input to check.
- **written** – 1 if the input is a pegin, otherwise 0.

Returns See [Error Codes](#)

```
int wally_tx_elements_output_commitment_set(struct wally_tx_output *output, const unsigned
                                             char *asset, size_t asset_len, const unsigned
                                             char *value, size_t value_len, const unsigned
                                             char *nonce, size_t nonce_len, const un-
                                             signed char *surjectionproof, size_t surjection-
                                             proof_len, const unsigned char *rangeproof,
                                             size_t rangeproof_len)
```

Set commitment data on an output.

Parameters

- **output** – The output to add to.

- **asset** – The commitment to a possibly blinded asset.
- **asset_len** – Size of asset in bytes. Must be WALLY_TX_ASSET_CT_ASSET_LEN.
- **value** – The commitment to a possibly blinded value.
- **value_len** – Size of value in bytes. Must be WALLY_TX_ASSET_CT_VALUE_LEN or WALLY_TX_ASSET_CT_VALUE_UNBLIND_LEN.
- **nonce** – The commitment used to create the nonce (with the blinding key) for the range proof.
- **nonce_len** – Size of nonce in bytes. Must be WALLY_TX_ASSET_CT_NONCE_LEN.
- **surjectionproof** – surjection proof.
- **surjectionproof_len** – Size of surjectionproof in bytes.
- **rangeproof** – rangeproof.
- **rangeproof_len** – Size of rangeproof in bytes.

Returns See *Error Codes*

```
int wally_tx_elements_output_commitment_free (struct wally_tx_output *output)
```

Free commitment data on an output.

Parameters

- **output** – The output with the commitment data to free.

Returns See *Error Codes*

```
int wally_tx_elements_output_init (const unsigned char *script, size_t script_len, const unsigned char *asset, size_t asset_len, const unsigned char *value, size_t value_len, const unsigned char *nonce, size_t nonce_len, const unsigned char *surjectionproof, size_t surjectionproof_len, const unsigned char *rangeproof, size_t rangeproof_len, struct wally_tx_output *output)
```

Initialize a new elements transaction output in place.

Parameters

- **script** – The scriptPubkey for the output.
- **script_len** – Size of script in bytes.
- **asset** – The asset tag of the output.
- **asset_len** – Size of asset in bytes. Must be WALLY_TX_ASSET_CT_ASSET_LEN.
- **value** – The commitment to a possibly blinded value.
- **value_len** – Size of value in bytes. Must be WALLY_TX_ASSET_CT_VALUE_LEN or WALLY_TX_ASSET_CT_VALUE_UNBLIND_LEN.
- **nonce** – The commitment used to create the nonce (with the blinding key) for the range proof.
- **nonce_len** – Size of nonce in bytes. Must be WALLY_TX_ASSET_CT_NONCE_LEN.
- **surjectionproof** – The surjection proof.
- **surjectionproof_len** – Size of surjectionproof in bytes.
- **rangeproof** – The range proof.
- **rangeproof_len** – Size of rangeproof in bytes.

- **output** – Destination for the resulting transaction output copy.

Note: `output` is overwritten in place, and not cleared first.

Returns See *Error Codes*

```
int wally_tx_elements_output_init_alloc(const unsigned char *script, size_t script_len, const
                                         unsigned char *asset, size_t asset_len, const un-
                                         signed char *value, size_t value_len, const un-
                                         signed char *nonce, size_t nonce_len, const unsigned
                                         char *surjectionproof, size_t surjectionproof_len,
                                         const unsigned char *rangeproof, size_t range-
                                         proof_len, struct wally_tx_output **output)
```

Allocate and initialize a new elements transaction output.

Parameters

- **script** – The scriptPubkey for the output.
- **script_len** – Size of `script` in bytes.
- **asset** – The asset tag of the output.
- **asset_len** – Size of `asset` in bytes. Must be `WALLY_TX_ASSET_CT_ASSET_LEN`.
- **value** – The commitment to a possibly blinded value.
- **value_len** – Size of `value` in bytes. Must be `WALLY_TX_ASSET_CT_VALUE_LEN` or `WALLY_TX_ASSET_CT_VALUE_UNBLIND_LEN`.
- **nonce** – The commitment used to create the nonce (with the blinding key) for the range proof.
- **nonce_len** – Size of `nonce` in bytes. Must be `WALLY_TX_ASSET_CT_NONCE_LEN`.
- **surjectionproof** – The surjection proof.
- **surjectionproof_len** – Size of `surjectionproof` in bytes.
- **rangeproof** – The range proof.
- **rangeproof_len** – Size of `rangeproof` in bytes.
- **output** – Destination for the resulting transaction output.

Returns See *Error Codes*

```
int wally_tx_add_elements_raw_input(struct wally_tx *tx, const unsigned char *txhash,
                                    size_t txhash_len, uint32_t utxo_index, uint32_t se-
                                    quence, const unsigned char *script, size_t script_len,
                                    const struct wally_tx_witness_stack *witness, const un-
                                    signed char *nonce, size_t nonce_len, const unsigned
                                    char *entropy, size_t entropy_len, const unsigned char *is-
                                    suance_amount, size_t issuance_amount_len, const
                                    unsigned char *inflation_keys, size_t inflation_keys_len,
                                    const unsigned char *issuance_amount_rangeproof,
                                    size_t issuance_amount_rangeproof_len, const
                                    unsigned char *inflation_keys_rangeproof,
                                    size_t inflation_keys_rangeproof_len, const struct
                                    wally_tx_witness_stack *pegin_witness, uint32_t flags)
```

Add an elements transaction input to a transaction.

Parameters

- **tx** – The transaction to add the input to.
- **txhash** – The transaction hash of the transaction this input comes from.
- **txhash_len** – Size of txhash in bytes. Must be WALLY_TXHASH_LEN.
- **utxo_index** – The zero-based index of the transaction output in txhash that this input comes from.
- **sequence** – The sequence number for the input.
- **script** – The scriptSig for the input.
- **script_len** – Size of script in bytes.
- **witness** – The witness stack for the input, or NULL if no witness is present.
- **nonce** – Asset issuance or revelation blinding factor.
- **nonce_len** – Size of nonce in bytes. Must be WALLY_TX_ASSET_TAG_LEN.
- **entropy** – Entropy for the asset tag calculation.
- **entropy_len** – Size of entropy in bytes. Must be WALLY_TX_ASSET_TAG_LEN.
- **issuance_amount** – The (blinded) issuance amount.
- **issuance_amount_len** – Size of issuance_amount in bytes.
- **inflation_keys** – The (blinded) token reissuance amount.
- **inflation_keys_len** – Size of inflation_keys in bytes.
- **issuance_amount_rangeproof** – Issuance amount rangeproof.
- **issuance_amount_rangeproof_len** – Size of issuance_amount_rangeproof in bytes.
- **inflation_keys_rangeproof** – Inflation keys rangeproof.
- **inflation_keys_rangeproof_len** – Size of inflation_keys_rangeproof in bytes.
- **egin_witness** – The egin witness stack for the input, or NULL if no witness is present.
- **flags** – Flags controlling input creation. Must be 0.

Returns See [Error Codes](#)

```
int wally_tx_add_elements_raw_input_at (struct wally_tx *tx, uint32_t index, const
                                         unsigned char *txhash, size_t txhash_len,
                                         uint32_t utxo_index, uint32_t sequence, const un-
                                         signed char *script, size_t script_len, const struct
                                         wally_tx_witness_stack *witness, const unsigned
                                         char *nonce, size_t nonce_len, const unsigned char *en-
                                         tropy, size_t entropy_len, const unsigned char *is-
                                         suance_amount, size_t issuance_amount_len, const un-
                                         signed char *inflation_keys, size_t inflation_keys_len,
                                         const unsigned char *issuance_amount_rangeproof,
                                         size_t issuance_amount_rangeproof_len, const
                                         unsigned char *inflation_keys_rangeproof,
                                         size_t inflation_keys_rangeproof_len, const
                                         struct wally_tx_witness_stack *pegin_witness,
                                         uint32_t flags)
```

Add an elements transaction input to a transaction at a given position.

Parameters

- **tx** – The transaction to add the input to.
- **index** – The zero-based index of the position to add the input at.
- **txhash** – The transaction hash of the transaction this input comes from.
- **txhash_len** – Size of txhash in bytes. Must be WALLY_TXHASH_LEN.
- **utxo_index** – The zero-based index of the transaction output in txhash that this input comes from.
- **sequence** – The sequence number for the input.
- **script** – The scriptSig for the input.
- **script_len** – Size of script in bytes.
- **witness** – The witness stack for the input, or NULL if no witness is present.
- **nonce** – Asset issuance or revelation blinding factor.
- **nonce_len** – Size of nonce in bytes. Must be WALLY_TX_ASSET_TAG_LEN.
- **entropy** – Entropy for the asset tag calculation.
- **entropy_len** – Size of entropy in bytes. Must be WALLY_TX_ASSET_TAG_LEN.
- **issuance_amount** – The (blinded) issuance amount.
- **issuance_amount_len** – Size of issuance_amount in bytes.
- **inflation_keys** – The (blinded) token reissuance amount.
- **inflation_keys_len** – Size of inflation_keys in bytes.
- **issuance_amount_rangeproof** – Issuance amount rangeproof.
- **issuance_amount_rangeproof_len** – Size of issuance_amount_rangeproof in bytes.
- **inflation_keys_rangeproof** – Inflation keys rangeproof.
- **inflation_keys_rangeproof_len** – Size of inflation_keys_rangeproof in bytes.
- **pegin_witness** – The peg-in witness stack for the input, or NULL if no witness is present.

- **flags** – Flags controlling input creation. Must be 0.

Returns See *Error Codes*

```
int wally_tx_add_elements_raw_output (struct wally_tx *tx, const unsigned char *script,
                                     size_t script_len, const unsigned char *asset, size_t asset_len,
                                     const unsigned char *value, size_t value_len,
                                     const unsigned char *nonce, size_t nonce_len, const unsigned char *surjectionproof, size_t surjectionproof_len,
                                     const unsigned char *rangeproof, size_t rangeproof_len,
                                     uint32_t flags)
```

Add a elements transaction output to a transaction.

Parameters

- **tx** – The transaction to add the output to.
- **script** – The scriptPubkey for the output.
- **script_len** – Size of script in bytes.
- **asset** – The asset tag of the output.
- **asset_len** – Size of asset in bytes. Must be WALLY_TX_ASSET_CT_ASSET_LEN.
- **value** – The commitment to a possibly blinded value.
- **value_len** – Size of value in bytes. Must be WALLY_TX_ASSET_CT_VALUE_LEN or WALLY_TX_ASSET_CT_VALUE_UNBLIND_LEN.
- **nonce** – The commitment used to create the nonce (with the blinding key) for the range proof.
- **nonce_len** – Size of nonce in bytes. Must be WALLY_TX_ASSET_CT_NONCE_LEN.
- **surjectionproof** – The surjection proof.
- **surjectionproof_len** – Size of surjectionproof in bytes.
- **rangeproof** – The range proof.
- **rangeproof_len** – Size of rangeproof in bytes.
- **flags** – Flags controlling output creation. Must be 0.

Returns See *Error Codes*

```
int wally_tx_add_elements_raw_output_at (struct wally_tx *tx, uint32_t index, const unsigned char *script, size_t script_len, const unsigned char *asset, size_t asset_len, const unsigned char *value, size_t value_len, const unsigned char *nonce, size_t nonce_len, const unsigned char *surjectionproof, size_t surjectionproof_len, const unsigned char *rangeproof, size_t rangeproof_len, uint32_t flags)
```

Add a elements transaction output to a transaction at a given position.

Parameters

- **tx** – The transaction to add the output to.
- **index** – The zero-based index of the position to add the output at.
- **script** – The scriptPubkey for the output.
- **script_len** – Size of script in bytes.

- **asset** – The asset tag of the output.
- **asset_len** – Size of asset in bytes. Must be WALLY_TX_ASSET_CT_ASSET_LEN.
- **value** – The commitment to a possibly blinded value.
- **value_len** – Size of value in bytes. Must be WALLY_TX_ASSET_CT_VALUE_LEN or WALLY_TX_ASSET_CT_VALUE_UNBLIND_LEN.
- **nonce** – The commitment used to create the nonce (with the blinding key) for the range proof.
- **nonce_len** – Size of nonce in bytes. Must be WALLY_TX_ASSET_CT_NONCE_LEN.
- **surjectionproof** – The surjection proof.
- **surjectionproof_len** – Size of surjectionproof in bytes.
- **rangeproof** – The range proof.
- **rangeproof_len** – Size of rangeproof in bytes.
- **flags** – Flags controlling output creation. Must be 0.

Returns See [Error Codes](#)

```
int wally_tx_is_elements(const struct wally_tx *tx, size_t *written)
```

Determine if a transaction is an elements transaction.

Parameters

- **tx** – The transaction to check.
- **written** – 1 if the transaction is an elements transaction, otherwise 0.

Returns See [Error Codes](#)

```
int wally_tx_confidential_value_from_satoshi(uint64_t satoshi, unsigned char *bytes_out,
                                              size_t len)
```

Convert satoshi to an explicit confidential value representation.

Parameters

- **satoshi** – The value in satoshi to convert.
- **bytes_out** – Destination for the confidential value bytes.
- **len** – Size of bytes_out in bytes. Must be WALLY_TX_ASSET_CT_VALUE_UNBLIND_LEN.

Returns See [Error Codes](#)

```
int wally_tx_confidential_value_to_satoshi(const unsigned char *value, size_t value_len,
                                            uint64_t *value_out)
```

Convert an explicit confidential value representation to satoshi.

Parameters

- **value** – The confidential value bytes.
- **value_len** – Size of value in bytes. Must be WALLY_TX_ASSET_CT_VALUE_UNBLIND_LEN.
- **value_out** – The converted value in satoshi.

Returns See [Error Codes](#)

```
int wally_tx_get_elements_signature_hash(const struct wally_tx *tx, size_t index, const unsigned char *script, size_t script_len, const unsigned char *value, size_t value_len, uint32_t sighash, uint32_t flags, unsigned char *bytes_out, size_t len)
```

Create a Elements transaction for signing and return its hash.

Parameters

- **tx** – The transaction to generate the signature hash from.
- **index** – The input index of the input being signed for.
- **script** – The (unprefixed) scriptCode for the input being signed.
- **script_len** – Size of script in bytes.
- **value** – The (confidential) value spent by the input being signed for. Only used if flags includes WALLY_TX_FLAG_USE_WITNESS, pass NULL otherwise.
- **value_len** – Size of value in bytes.
- **sighash** – WALLY_SIGHASH_ flags specifying the type of signature desired.
- **flags** – WALLY_TX_FLAG_USE_WITNESS to generate a BIP 143 signature, or 0 to generate a pre-segwit Bitcoin signature.
- **bytes_out** – Destination for the signature hash.
- **len** – Size of bytes_out in bytes. Must be SHA256_LEN.

Returns See [Error Codes](#)

```
int wally_tx_elements_issuance_generate_entropy(const unsigned char *txhash, size_t txhash_len, uint32_t index, const unsigned char *contract_hash, size_t contract_hash_len, unsigned char *bytes_out, size_t len)
```

Calculate the asset entropy from a prevout and the Ricardian contract hash.

Parameters

- **txhash** – The prevout transaction hash.
- **txhash_len** – Size of txhash in bytes. Must be WALLY_TXHASH_LEN.
- **utxo_index** – The zero-based index of the transaction output in txhash to use.
- **contract_hash** – The issuer specified Ricardian contract hash.
- **contract_hash_len** – Size of contract hash in bytes. Must be SHA256_LEN.
- **bytes_out** – Destination for the asset entropy.
- **len** – Size of bytes_out in bytes. Must be SHA256_LEN.

Returns See [Error Codes](#)

```
int wally_tx_elements_issuance_calculate_asset(const unsigned char *entropy, size_t entropy_len, unsigned char *bytes_out, size_t len)
```

Calculate the asset from the entropy.

Parameters

- **entropy** – The asset entropy.
- **entropy_len** – Size of entropy in bytes. Must be SHA256_LEN.

- **bytes_out** – Destination for the asset tag.
- **len** – Size of bytes_out in bytes. Must be SHA256_LEN.

Returns See [Error Codes](#)

```
int wally_tx_elements_issuance_calculate_reissuance_token(const unsigned char *entropy, size_t entropy_len, uint32_t flags, unsigned char *bytes_out, size_t len)
```

Calculate a re-issuance token from an asset's entropy.

Parameters

- **entropy** – The asset entropy.
- **entropy_len** – Size of entropy in bytes. Must be SHA256_LEN.
- **flags** – WALLY_TX_FLAG_BLINDED_INITIAL_ISSUANCE if initial issuance was blinded, pass 0 otherwise.
- **bytes_out** – Destination for the re-issuance token.
- **len** – Size of bytes_out in bytes. Must be SHA256_LEN.

Returns See [Error Codes](#)

CHAPTER 12

Elements Functions

```
int wally_asset_generator_from_bytes(const unsigned char *asset, size_t asset_len, const un-
signed char *abf, size_t abf_len, unsigned char *bytes_out,
size_t len)
```

Create an Asset Generator from an either an asset commitment or asset tag plus blinding factor.

Parameters

- **asset** – Asset Commitment or Tag to create a generator for.
- **asset_len** – Length of asset in bytes. Must be ASSET_COMMITMENT_LEN or ASSET_TAG_LEN.
- **abf** – Asset Blinding Factor (Random entropy to blind with). Must be NULL when asset is a commitment.
- **abf_len** – Length of abf in bytes. Must be BLINDING_FACTOR_LEN if abf is non-NULL.
- **bytes_out** – Destination for the resulting Asset Generator.
- **len** – The length of bytes_out in bytes. Must be ASSET_GENERATOR_LEN.

Returns See [Error Codes](#)

```
int wally_ecdh_nonce_hash(const unsigned char *pub_key, size_t pub_key_len, const unsigned
char *priv_key, size_t priv_key_len, unsigned char *bytes_out, size_t len)
```

Generate a rangeproof nonce hash via SHA256(ECDH(pub_key, priv_key)).

Parameters

- **pub_key** – Public blinding key.
- **pub_key_len** – Length of pub_key in bytes. Must be EC_PUBLIC_KEY_LEN
- **priv_key** – Ephemeral (randomly generated) private key.
- **priv_key_len** – Length of priv_key in bytes. Must be EC_PRIVATE_KEY_LEN.
- **bytes_out** – Destination for the resulting nonce hash.
- **len** – Length of bytes_out. Must be SHA256_LEN.

Note: The public blinding key can be retrieved from a confidential address using `wally_confidential_addr_to_ec_public_key`. If `priv_key` is invalid, then `WALLY_ERROR` is returned.

Note: The computation can also be performed with the private key corresponding to `pub_key` and the public key corresponding to `priv_key` giving the same result.

Returns See [Error Codes](#)

```
int wally_asset_final_vbf(const uint64_t *values, size_t values_len, size_t num_inputs, const unsigned char *abf, size_t abf_len, const unsigned char *vbf, size_t vbf_len,  
                           unsigned char *bytes_out, size_t len)
```

Generate the final value blinding factor required for blinding a confidential transaction.

Parameters

- **values** – Array of values in satoshi
- **values_len** – Length of `values`, also the number of elements in all three of the input arrays, which is equal to `num_inputs` plus the number of outputs.
- **num_inputs** – Number of elements in the input arrays that represent inputs. The number of outputs is implicitly `values_len - num_inputs`.
- **abf** – Array of bytes representing `values_len` asset blinding factors.
- **abf_len** – Length of `abf` in bytes. Must be `values_len * BLINDING_FACTOR_LEN`.
- **vbf** – Array of bytes representing `(values_len - 1)` value blinding factors.
- **vbf_len** – Length of `vbf` in bytes. Must be `(values_len - 1) * BLINDING_FACTOR_LEN`.
- **bytes_out** – Buffer to receive the final value blinding factor.
- **len** – Length of `bytes_out`. Must be `BLINDING_FACTOR_LEN`.

Returns See [Error Codes](#)

```
int wally_asset_scalar_offset(uint64_t value, const unsigned char *abf, size_t abf_len, const unsigned char *vbf, size_t vbf_len, unsigned char *bytes_out,  
                             size_t len)
```

Compute the scalar offset used for blinding a confidential transaction.

Parameters

- **value** – The value in satoshi.
- **abf** – Asset blinding factor.
- **abf_len** – Length of `abf`. Must be `BLINDING_FACTOR_LEN`.
- **vbf** – Value blinding factor.
- **vbf_len** – Length of `vbf`. Must be `BLINDING_FACTOR_LEN`.
- **bytes_out** – Destination to receive the scalar offset.
- **len** – Length of `bytes_out`. Must be `EC_SCALAR_LEN`.

Returns See [Error Codes](#)

```
int wally_asset_value_commitment(uint64_t value, const unsigned char *vbf, size_t vbf_len,
                                 const unsigned char *generator, size_t generator_len, unsigned
                                 char *bytes_out, size_t len)
```

Calculate a value commitment.

Parameters

- **value** – Output value in satoshi.
- **vbf** – Value Blinding Factor.
- **vbf_len** – Length of vbf. Must be BLINDING_FACTOR_LEN.
- **generator** – Asset generator from [wally_asset_generator_from_bytes](#).
- **generator_len** – Length of generator. Must be ASSET_GENERATOR_LEN.
- **bytes_out** – Buffer to receive value commitment.
- **len** – Length of bytes_out. Must be ASSET_COMMITMENT_LEN.

Returns See [Error Codes](#)

```
int wally_asset_rangeproof_with_nonce(uint64_t value, const unsigned char *nonce_hash,
                                       size_t nonce_hash_len, const unsigned char *asset,
                                       size_t asset_len, const unsigned char *abf,
                                       size_t abf_len, const unsigned char *vbf, size_t vbf_len,
                                       const unsigned char *commitment, size_t commitment_len,
                                       const unsigned char *extra, size_t extra_len,
                                       const unsigned char *generator, size_t generator_len,
                                       uint64_t min_value, int exp, int min_bits, unsigned
                                       char *bytes_out, size_t len, size_t *written)
```

Generate a rangeproof using a nonce.

Parameters

- **value** – Value of the output in satoshi.
- **nonce_hash** – Nonce for rangeproof generation, usually from [wally_ecdh_nonce_hash](#).
- **nonce_hash_len** – Length of nonce_hash. Must be SHA256_LEN.
- **asset** – Asset id of output.
- **asset_len** – Length of asset. Must be ASSET_TAG_LEN.
- **abf** – Asset blinding factor. Randomly generated for each output.
- **abf_len** – Length of abf. Must be BLINDING_FACTOR_LEN.
- **vbf** – Value blinding factor. Randomly generated for each output except the last, which is generate by calling [wally_asset_final_vbf](#).
- **vbf_len** – Length of vbf. Must be BLINDING_FACTOR_LEN.
- **commitment** – Value commitment from [wally_asset_value_commitment](#).
- **commitment_len** – Length of commitment. Must be ASSET_COMMITMENT_LEN.
- **extra** – Set this to the script pubkey of the output.
- **extra_len** – Length of extra, i.e. script pubkey.
- **generator** – Asset generator from [wally_asset_generator_from_bytes](#).

- **generator_len** – Length of generator` . Must be `` ASSET_GENERATOR_LEN.
- **min_value** – Recommended value 1.
- **exp** – Exponent value. -1 >= exp >= 18. Recommended value 0.
- **min_bits** – 0 >= min_bits >= 64. Recommended value 52.
- **bytes_out** – Buffer to receive rangeproof.
- **len** – Length of bytes_out. See ASSET_RANGEPROOF_MAX_LEN.
- **written** – Number of bytes actually written to bytes_out.

Returns See *Variable Length Output Buffers*

```
int wally_asset_rangeproof(uint64_t value, const unsigned char *pub_key, size_t pub_key_len, const
                           unsigned char *priv_key, size_t priv_key_len, const unsigned char *asset,
                           size_t asset_len, const unsigned char *abf, size_t abf_len, const unsigned
                           char *vbf, size_t vbf_len, const unsigned char *commitment, size_t com-
                           mitment_len, const unsigned char *extra, size_t extra_len, const un-
                           signed char *generator, size_t generator_len, uint64_t min_value, int exp,
                           int min_bits, unsigned char *bytes_out, size_t len, size_t *written)
```

Generate a rangeproof.

This convenience function generates a nonce hash with `wally_ecdh_nonce_hash` and then calls `wally_asset_rangeproof_with_nonce`.

Returns See *Variable Length Output Buffers*

```
int wally_explicit_rangeproof(uint64_t value, const unsigned char *nonce, size_t nonce_len, const
                               unsigned char *vbf, size_t vbf_len, const unsigned char *commitment,
                               size_t commitment_len, const unsigned char *generator, size_t gen-
                               erator_len, unsigned char *bytes_out, size_t len, size_t *written)
```

Generate an explicit value rangeproof.

The nonce for this function should be randomly generated. See `wally_asset_rangeproof_with_nonce`.

Returns See *Variable Length Output Buffers*

```
int wally_explicit_rangeproof_verify(const unsigned char *rangeproof, size_t rangeproof_len,
                                      uint64_t value, const unsigned char *commitment,
                                      size_t commitment_len, const unsigned char *generator,
                                      size_t generator_len)
```

Verify an explicit value rangeproof proves a given value.

Parameters

- **rangeproof** – The explicit value rangeproof to validate.
- **rangeproof_len** – Length of rangeproof in bytes.
- **value** – The expected value that the explicit rangeproof proves.
- **commitment** – Value commitment from `wally_asset_value_commitment`.
- **commitment_len** – Length of commitment. Must be ASSET_COMMITMENT_LEN.
- **generator** – Asset generator from `wally_asset_generator_from_bytes`.
- **generator_len** – Length of generator` . Must be `` ASSET_GENERATOR_LEN.

Returns See *Error Codes*

```
int wally_asset_surjectionproof_size(size_t num_inputs, size_t *written)
```

Return the required buffer size for receiving a surjection proof

Parameters

- **num_inputs** – Number of inputs.
- **written** – Destination for the surjection proof size.

Returns

See [Error Codes](#)

```
int wally_asset_surjectionproof(const unsigned char *output_asset, size_t output_asset_len, const
                                unsigned char *output_abf, size_t output_abf_len, const unsigned
                                char *output_generator, size_t output_generator_len, const un-
                                signed char *bytes, size_t bytes_len, const unsigned char *as-
                                set, size_t asset_len, const unsigned char *abf, size_t abf_len,
                                const unsigned char *generator, size_t generator_len, unsigned
                                char *bytes_out, size_t len, size_t *written)
```

Generate an asset surjection proof.

Parameters

- **output_asset** – asset id for the output.
- **output_asset_len** – Length of asset. Must be ASSET_TAG_LEN.
- **output_abf** – Asset blinding factor for the output. Generated randomly for each output.
- **output_abf_len** – Length of output_abf. Must be BLINDING_FACTOR_LEN.
- **output_generator** – Asset generator from [wally_asset_generator_from_bytes](#).
- **output_generator_len** – Length of output_generator. Must be ASSET_GENERATOR_LEN.
- **bytes** – Must be generated randomly for each output.
- **bytes_len** – Length of bytes. Must be 32.
- **asset** – Array of input asset tags.
- **asset_len** – Length of asset. Must be ASSET_TAG_LEN * number of inputs.
- **abf** – Array of input asset blinding factors.
- **abf_len** – Length of abf. Must be BLINDING_FACTOR_LEN * number of inputs.
- **generator** – Array of input asset generators.
- **generator_len** – Length of generator. Must be ASSET_GENERATOR_LEN * number of inputs.
- **bytes_out** – Buffer to receive surjection proof.
- **bytes_out_len** – Length of bytes_out. See [wally_asset_surjectionproof_size](#).
- **written** – Number of bytes actually written to bytes_out.

Returns

See [Variable Length Output Buffers](#)

```
int wally_explicit_surjectionproof(const unsigned char *output_asset, size_t output_asset_len,
                                    const unsigned char *output_abf, size_t output_abf_len,
                                    const unsigned char *output_generator, size_t out-
                                    put_generator_len, unsigned char *bytes_out, size_t len)
```

Generate an explicit asset surjection proof.

Parameters

- **output_asset** – asset id for the output.
- **output_asset_len** – Length of asset. Must be ASSET_TAG_LEN.
- **output_abf** – Asset blinding factor for the output. Generated randomly for each output.
- **output_abf_len** – Length of output_abf. Must be BLINDING_FACTOR_LEN.
- **output_generator** – Asset generator from [wally_asset_generator_from_bytes](#).
- **output_generator_len** – Length of output_generator` . Must be ``ASSET_GENERATOR_LEN.
- **bytes_out** – Buffer to receive surjection proof.
- **bytes_out_len** – Length of bytes_out. Must be ASSET_EXPLICIT_SURJECTIONPROOF_LEN.

Returns

See [Error Codes](#)

```
int wally_explicit_surjectionproof_verify(const unsigned char *surjectionproof, size_t surjectionproof_len, const unsigned char *output_asset, size_t output_asset_len, const unsigned char *output_generator, size_t output_generator_len)
```

Verify an explicit asset surjection proof proves a given asset.

Parameters

- **surjectionproof** – The explicit asset surjection proof.
- **surjectionproof_len** – Length of surjectionproof.
- **output_asset** – The unblinded asset we expect surjectionproof to prove.
- **output_asset_len** – Length of asset. Must be ASSET_TAG_LEN.
- **output_generator** – Asset generator from [wally_asset_generator_from_bytes](#).
- **output_generator_len** – Length of output_generator` . Must be ``ASSET_GENERATOR_LEN.

Returns

See [Error Codes](#)

```
int wally_asset_unblind_with_nonce(const unsigned char *nonce_hash, size_t nonce_hash_len, const unsigned char *proof, size_t proof_len, const unsigned char *commitment, size_t commitment_len, const unsigned char *extra, size_t extra_len, const unsigned char *generator, size_t generator_len, unsigned char *abf_out, size_t abf_out_len, unsigned char *vbf_out, size_t vbf_out_len, uint64_t *value_out)
```

Unblind a confidential transaction output.

Parameters

- **nonce_hash** – SHA-256 hash of the generated nonce.
- **nonce_hash_len** – Length of nonce_hash. Must be SHA256_LEN.
- **proof** – Rangeproof from [wally_tx_get_output_rangeproof\(\)](#).
- **proof_len** – Length of proof.
- **commitment** – Value commitment from [wally_tx_get_output_value\(\)](#).

- **commitment_len** – Length of commitment.
- **extra** – Script pubkey from `wally_tx_get_output_script()`.
- **extra_len** – Length of extra.
- **generator** – Asset generator from `wally_tx_get_output_asset()`.
- **generator_len** – Length of generator. Must be `ASSET_GENERATOR_LEN`.
- **asset_out** – Buffer to receive unblinded asset id.
- **asset_out_len** – Length of `asset_out`. Must be `ASSET_TAG_LEN`.
- **abf_out** – Buffer to receive asset blinding factor.
- **abf_out_len** – Length of `abf_out`. Must be `BLINDING_FACTOR_LEN`.
- **vbf_out** – Buffer to receive asset blinding factor.
- **vbf_out_len** – Length of `vbf_out`. Must be `BLINDING_FACTOR_LEN`.
- **value_out** – Destination for unblinded transaction output value.

Returns See [Error Codes](#)

```
int wally_asset_unblind(const unsigned char *pub_key, size_t pub_key_len, const unsigned
                        char *priv_key, size_t priv_key_len, const unsigned char *proof,
                        size_t proof_len, const unsigned char *commitment, size_t commitment_len,
                        const unsigned char *extra, size_t extra_len, const unsigned char *generator,
                        size_t generator_len, unsigned char *asset_out, size_t asset_out_len, unsigned
                        char *abf_out, size_t abf_out_len, unsigned char *vbf_out, size_t vbf_out_len,
                        uint64_t *value_out)
```

Unblind a confidential transaction output.

Parameters

- **pub_key** – From `wally_tx_get_output_nonce()`.
- **pub_key_len** – Length of `pub_key`. Must be `EC_PUBLIC_KEY_LEN`.
- **priv_key** – Private blinding key corresponding to public blinding key used to generate destination address. See [`wally_asset_blinding_key_to_ec_private_key\(\)`](#).
- **proof** – Rangeproof from `wally_tx_get_output_rangeproof()`.
- **proof_len** – Length of `proof`.
- **commitment** – Value commitment from `wally_tx_get_output_value()`.
- **commitment_len** – Length of `commitment`.
- **extra** – Script pubkey from `wally_tx_get_output_script()`.
- **extra_len** – Length of `extra`.
- **generator** – Asset generator from `wally_tx_get_output_asset()`.
- **generator_len** – Length of generator. Must be `ASSET_GENERATOR_LEN`.
- **asset_out** – Buffer to receive unblinded asset id.
- **asset_out_len** – Length of `asset_out`. Must be `ASSET_TAG_LEN`.
- **abf_out** – Buffer to receive asset blinding factor.
- **abf_out_len** – Length of `abf_out`. Must be `BLINDING_FACTOR_LEN`.
- **vbf_out** – Buffer to receive asset blinding factor.

- **vbf_out_len** – Length of vbf_out. Must be BLINDING_FACTOR_LEN.
- **value_out** – Destination for unblinded transaction output value.

Returns See [Error Codes](#)

```
int wally_asset_blinding_key_from_seed(const unsigned char *bytes, size_t bytes_len, unsigned
                                         char *bytes_out, size_t len)
```

Generate a master blinding key from a seed as specified in SLIP-0077.

Parameters

- **bytes** – Seed value. See [bip39_mnemonic_to_seed\(\)](#).
- **bytes_len** – Length of bytes. Must be one of BIP32_ENTROPY_LEN_128, BIP32_ENTROPY_LEN_256 or BIP32_ENTROPY_LEN_512.
- **bytes_out** – Buffer to receive master blinding key. The master blinding key can be used to generate blinding keys for specific outputs by passing it to [wally_asset_blinding_key_to_ec_private_key](#).
- **len** – Length of bytes_out. Must be HMAC_SHA512_LEN.

Returns See [Error Codes](#)

```
int wally_asset_blinding_key_to_ec_private_key(const unsigned char *bytes,
                                               size_t bytes_len, const unsigned
                                               char *script, size_t script_len, unsigned
                                               char *bytes_out, size_t len)
```

Generate a blinding key for a script pubkey.

Parameters

- **bytes** – Master blinding key from [wally_asset_blinding_key_from_seed](#).
- **bytes_len** – Length of bytes. Must be HMAC_SHA512_LEN.
- **script** – The script pubkey for the confidential output address.
- **script_len** – Length of script.
- **bytes_out** – Buffer to receive blinding key.
- **len** – Length of bytes_out. Must be EC_PRIVATE_KEY_LEN.

Returns See [Error Codes](#)

```
int wally_asset_pak_whitelistproof_size(size_t num_keys, size_t *written)
```

Calculate the size in bytes of the whitelist proof.

Parameters

- **num_keys** – The number of offline/online keys.
- **written** – Destination for the number of bytes needed for the proof.

Returns See [Error Codes](#)

```
int wally_asset_pak_whitelistproof(const unsigned char *online_keys, size_t online_keys_len,
                                   const unsigned char *offline_keys, size_t offline_keys_len,
                                   size_t key_index, const unsigned char *sub_pubkey,
                                   size_t sub_pubkey_len, const unsigned char *on-
                                   line_priv_key, size_t online_priv_key_len, const unsigned
                                   char *summed_key, size_t summed_key_len, unsigned
                                   char *bytes_out, size_t len, size_t *written)
```

Generate the whitelist proof for the pegout script.

Parameters

- **online_keys** – The list of online keys.
- **online_keys_len** – Length of `online_keys` in bytes. Must be a multiple of `EC_PUBLIC_KEY_LEN`.
- **offline_keys** – The list of offline keys.
- **offline_keys_len** – Length of `offline_keys` in bytes. Must be a multiple of `EC_PUBLIC_KEY_LEN`.
- **key_index** – The index in the PAK list of the key signing this whitelist proof
- **sub_pubkey** – The key to be whitelisted.
- **sub_pubkey_len** – Length of `sub_pubkey` in bytes. Must be `EC_PUBLIC_KEY_LEN`.
- **online_priv_key** – The secret key to the signer's online pubkey.
- **online_priv_key_len** – Length of `online_priv_key` in bytes. Must be `EC_PRIVATE_KEY_LEN`.
- **summed_key** – The secret key to the sum of (whitelisted key, signer's offline pubkey).
- **summed_key_len** – Length of `summed_key` in bytes. Must be `EC_PRIVATE_KEY_LEN`.
- **bytes_out** – Destination for the resulting whitelist proof.
- **len** – Length of `bytes_out` in bytes.
- **written** – Number of bytes actually written to `bytes_out`.

Returns See [Variable Length Output Buffers](#)

CHAPTER 13

Anti-Exfil Functions

```
int wally_ae_host_commit_from_bytes(const unsigned char *entropy, size_t entropy_len,
                                    uint32_t flags, unsigned char *bytes_out, size_t len)
```

Create the initial commitment to host randomness.

Parameters

- **entropy** – Randomness to commit to. It must come from a cryptographically secure RNG. As per the protocol, this value must not be revealed to the client until after the host has received the client commitment.
- **entropy_len** – The length of `entropy` in bytes. Must be `WALLY_S2C_DATA_LEN`.
- **flags** – Must be `EC_FLAG_ECDSA`.
- **bytes_out** – Destination for the resulting compact signature.
- **len** – The length of `bytes_out` in bytes. Must be `WALLY_HOST_COMMITMENT_LEN`.

Returns

See [Error Codes](#)

```
int wally_ae_signer_commit_from_bytes(const unsigned char *priv_key, size_t priv_key_len,
                                      const unsigned char *bytes, size_t bytes_len, const
                                      unsigned char *commitment, size_t commitment_len,
                                      uint32_t flags, unsigned char *s2c_opening_out,
                                      size_t s2c_opening_out_len)
```

Compute signer's original nonce.

Parameters

- **priv_key** – The private key used for signing.
- **priv_key_len** – The length of `priv_key` in bytes. Must be `EC_PRIVATE_KEY_LEN`.
- **bytes** – The message hash to be signed.
- **bytes_len** – The length of `bytes` in bytes. Must be `EC_MESSAGE_HASH_LEN`.
- **commitment** – Randomness commitment from the host.

- **commitment_len** – The length of commitment in bytes. Must be WALLY_HOST_COMMITMENT_LEN.
- **flags** – Must be EC_FLAG_ECDSA.
- **s2c_opening_out** – Destination for the resulting opening information.
- **s2c_opening_out_len** – The length of s2c_opening_out in bytes. Must be WALLY_S2C_OPENING_LEN.

Returns See [Error Codes](#)

```
int wally_ae_sig_from_bytes(const unsigned char *priv_key, size_t priv_key_len, const unsigned
                            char *bytes, size_t bytes_len, const unsigned char *entropy, size_t entropy_len,
                            uint32_t flags, unsigned char *bytes_out, size_t len)
```

Same as wally_ec_sig_from_bytes, but commits to the host randomness.

Parameters

- **priv_key** – The private key to sign with.
- **priv_key_len** – The length of priv_key in bytes. Must be EC_PRIVATE_KEY_LEN.
- **bytes** – The message hash to sign.
- **bytes_len** – The length of bytes in bytes. Must be EC_MESSAGE_HASH_LEN.
- **entropy** – Host provided randomness.
- **entropy_len** – The length of entropy in bytes. Must be WALLY_S2C_DATA_LEN.
- **flags** – Must be EC_FLAG_ECDSA.
- **bytes_out** – Destination for the resulting compact signature.
- **len** – The length of bytes_out in bytes. Must be EC_SIGNATURE_LEN.

Returns See [Error Codes](#)

```
int wally_ae_verify(const unsigned char *pub_key, size_t pub_key_len, const unsigned char *bytes,
                     size_t bytes_len, const unsigned char *entropy, size_t entropy_len, const unsigned
                     char *s2c_opening, size_t s2c_opening_len, uint32_t flags, const unsigned char *sig,
                     size_t sig_len)
```

Verify a signature was correctly constructed using the Anti-Exfil Protocol.

Parameters

- **pub_key** – The public key to verify with.
- **pub_key_len** – The length of pub_key in bytes. Must be EC_PUBLIC_KEY_LEN.
- **bytes** – The message hash to verify.
- **bytes_len** – The length of bytes in bytes. Must be EC_MESSAGE_HASH_LEN.
- **entropy** – Randomness provided by the host.
- **entropy_len** – The length of entropy in bytes. Must be WALLY_S2C_DATA_LEN.
- **s2c_opening** – Opening information provided by the signer.
- **s2c_opening_len** – The length of s2c_opening in bytes. Must be WALLY_S2C_OPENING_LEN.
- **flags** – Must be EC_FLAG_ECDSA.
- **sig** – The compact signature of the message in bytes.

- **sig_len** – The length of `sig` in bytes. Must be `EC_SIGNATURE_LEN`.

Returns See *Error Codes*

CHAPTER 14

Library Conventions

14.1 Error Codes

The following values can be returned by library functions:

Code	Meaning
WALLY_OK	The function completed without error. See Variable Length Output Buffers if applicable for the function.
WALLY_ERROR	An internal or unexpected error happened in the library. In some cases this code may indicate a specific error condition which will be documented with the function.
WALLY EINVAL	One or more parameters passed to the function is not valid. For example, a required buffer value is NULL or of the wrong length.
WALLY_ENOMEM	The function required memory allocation but no memory could be allocated from the O/S.

14.2 Variable Length Output Buffers

Some functions write output that can vary in length to user supplied buffers. In these cases, the number of written bytes is placed in the `written` output parameter when the function completes.

If the user supplied buffer is of insufficient size, these functions will still return `WALLY_OK`, but will place the required size in the `written` output parameter.

Callers must check not only that the function succeeds, but also that the number of bytes written is less than or equal to the supplied buffer size. If the buffer is too small, it should be resized to the returned size and the call retried.

CHAPTER 15

Liquid

The following walkthrough demonstrates how to use libwally to create a transaction spending a confidential liquid utxo. For documentation of the Blockstream Liquid network please go to [Blockstream](#)

The example code here is written in python using the generated python swig wrappers.

15.1 Generating a confidential address

Start by creating a standard p2pkh address. Assume that we have defined `mnemonic` as a 24 word mnemonic for the wallet we want to use. From this we can derive bip32 keys depending on the requirements of the wallet.

```
_, seed = wally.bip39_mnemonic_to_seed512(mnemonic, '')
wallet_master_key = wally.bip32_key_from_seed(
    seed,
    wally.BIP32_VER_TEST_PRIVATE, 0)
wallet_derived_key = wally.bip32_key_from_parent(
    wallet_master_key,
    1,
    wally.BIP32_FLAG_KEY_PRIVATE)
address = wally.bip32_key_to_address(
    wallet_derived_key,
    wally.WALLY_ADDRESS_TYPE_P2PKH,
    wally.WALLY_ADDRESS_VERSION_P2PKH_LIQUID_REGTEST)
```

For each new receive address a blinding key should be deterministically derived from a master blinding key, itself derived from the bip39 mnemonic for the wallet. wally provides the function `wally_asset_blinding_key_from_seed()` which can be used to derive a master blinding key from a mnemonic.

```
master_blinding_key = wally.asset_blinding_key_from_seed(seed)
script_pubkey = wally.address_to_scriptpubkey(
    address,
    wally.WALLY_NETWORK_LIQUID_REGTEST)
```

(continues on next page)

(continued from previous page)

```
private_blinding_key = wally.asset_blinding_key_to_ec_private_key(
    master_blinding_key,
    script_pubkey)
public_blinding_key = wally.ec_public_key_from_private_key(
    private_blinding_key)
```

Finally call the wally function `wally_confidential_addr_from_addr()` to combine the non-confidential address with the public blinding key to create a confidential address. We also supply a blinding prefix indicating the network version.

```
confidential_address = wally.confidential_addr_from_addr(
    address,
    wally.WALLY_CA_PREFIX_LIQUID_REGTEST,
    public_blinding_key)
```

The confidential address can now be passed to liquid-cli to receive funds. We'll send 1.1 BTC to our confidential address and save the raw hex transaction for further processing.

```
$ liquid-cli getrawtransaction $ (sendtoaddress <confidential address> 1.1)
```

15.2 Receiving confidential assets

On receiving confidential (blinded) utxos you can use libwally to unblind and inspect them. Take the hex transaction returned by getrawtransaction above and create a libwally tx.

```
tx = wally.tx_from_hex(
    tx_hex,
    wally.WALLY_TX_FLAG_USE_ELEMENTS | wally.WALLY_TX_FLAG_USE_WITNESS)
```

The transaction will likely have three outputs: the utxo paying to our confidential address, a change output and an explicit fee output(Liquid transactions differ from standard bitcoin transaction in that the fee is an explicit output). Iterate over the transaction outputs and unblind any addressed to us.

```
asset_generators_in = b''
asset_ids_in = b''
values_in = []
abfs_in = b''
vbfs_in = b''
script_pubkeys_in = []
vouts_in = []
num_outputs = wally.tx_get_num_outputs(tx)
for vout in range(num_outputs):
    script_pubkey_out = wally.tx_get_output_script(tx, vout)
    if script_pubkey_out != script_pubkey:
        continue

    vouts_in.append(vout)

    sender_ephemeral_pubkey = wally.tx_get_output_nonce(tx, vout)
    rangeproof = wally.tx_get_output_rangeproof(tx, vout)
    script_pubkey = wally.tx_get_output_script(tx, vout)
    asset_id = wally.tx_get_output_asset(tx, vout)
    value_commitment = wally.tx_get_output_value(tx, vout)
```

(continues on next page)

(continued from previous page)

```

script_pubkeys_in.append(script_pubkey)

value, asset_id, abf, vbf = wally.asset_unblind(
    sender_ephemeral_pubkey,
    private_blinding_key,
    rangeproof,
    value_commitment,
    script_pubkey,
    asset_id)

asset_generator = wally.asset_generator_from_bytes(asset_id, abf)

asset_generators_in += asset_generator
asset_ids_in += asset_id
values_in.append(value)
abfs_in += abf
vbfs_in += vbf

```

We have now unblinded the values and asset ids of the utxos. We've also saved the abfs (asset blinding factors) and vbfs (value binding factors) because they are needed for the next step: spending the utxos.

15.3 Spending confidential assets

The wallet logic will define the transaction outputs, values and fees. Here we assume that we're only dealing with a single asset and a single confidential recipient address destination_address to which we'll pay the input amount less some fixed fee.

```

total_in = sum(values_in)
output_values = [total_in - fee,]
confidential_output_addresses = [destination_address,]
output_asset_ids = asset_ids_in[:wally.ASSET_TAG_LEN]

```

Generate blinding factors for the outputs. These are asset blinding factors (abf) and value blinding factors (vbf). The blinding factors are random except for the final vbf which must be calculated by calling `wally_asset_final_vbf()`.

```

num_inputs = len(values_in)
num_outputs = 1
abfs_out = os.urandom(32 * num_outputs)
vbfs_out = os.urandom(32 * (num_outputs - 1))
vbfs_out += wally.asset_final_vbf(
    values_in + output_values,
    num_inputs,
    abfs_in + abfs_out,
    vbfs_in + vbfs_out)

```

A confidential output address can be decomposed into a standard address plus the public blinding key, and the libwally function `wally_address_to_scriptpubkey()` will provide the corresponding script pubkey.

```

blinding_pubkeys = [
    wally.confidential_addr_to_ec_public_key(
        confidential_address, address_prefix)
    for confidential_address in confidential_output_addresses]

```

(continues on next page)

(continued from previous page)

```

non_confidential_addresses = [
    wally.confidential_addr_to_addr(
        confidential_address, address_prefix)
    for confidential_address in confidential_output_addresses]

script_pubkeys = [
    wally.address_to_scriptpubkey(
        non_confidential_address, network)
    for non_confidential_address in non_confidential_addresses]

```

Create a new transaction

```

version = 2
locktime = 0
output_tx = wally.tx_init(version, locktime, 0, 0)

```

Iterate over the outputs and calculate the value commitment, rangeproof and surjectionproofs. This requires generating a random ephemeral public/private ec key pair for each blinded output.

```

for value, blinding_pubkey, script_pubkey in zip(
    output_values, blinding_pubkeys, script_pubkeys):

    abf, abfs_out = abfs_out[:32], abfs_out[32:]
    vbf, vbfs_out = vbfs_out[:32], vbfs_out[32:]
    asset_id, output_asset_ids = output_asset_ids[:32], output_asset_ids[32:]

    generator = wally.asset_generator_from_bytes(asset_id, abf)

    value_commitment = wally.asset_value_commitment(
        value, vbf, generator)

    ephemeral_privkey = os.urandom(32)
    ephemeral_pubkey = wally.ec_public_key_from_private_key(
        ephemeral_privkey)

    rangeproof = wally.asset_rangeproof(
        value,
        blinding_pubkey,
        ephemeral_privkey,
        asset_id,
        abf,
        vbf,
        value_commitment,
        script_pubkey,
        generator,
        1, # min_value
        0, # exponent
        36 # bits
    )

    surjectionproof = wally.asset_surjectionproof(
        asset_id,
        abf,
        generator,
        os.urandom(32),

```

(continues on next page)

(continued from previous page)

```

        asset_ids_in,
        abfs_in,
        asset_generators_in
    )

    wally.tx_add_elements_raw_output(
        output_tx,
        script_pubkey,
        generator,
        value_commitment,
        ephemeral_pubkey,
        surjectionproof,
        rangeproof,
        0
)

```

Finally the fee output must be explicitly added (unlike standard Bitcoin transactions where the fee is implicit). The fee is always payable in the bitcoin asset. The wallet logic will determine the fee amount.

```

BITCOIN = "5ac9f65c0efcc4775e0baec4ec03abdde22473cd3cf33c0419ca290e0751b225"
BITCOIN = wally.hex_to_bytes(BITCOIN) [::-1]

wally.tx_add_elements_raw_output(
    output_tx,
    None,
    bytearray([0x01]) + BITCOIN,
    wally.tx_confidential_value_from_satoshi(fee),
    None, # nonce
    None, # surjection proof
    None, # range proof
    0
)

```

Sign the transaction inputs.

```

flags = 0
prev_txid = wally.tx_get_txid(tx)
for vout in vouts_in:

    wally.tx_add_elements_raw_input(
        output_tx,
        prev_txid,
        vout,
        0xffffffff,
        None, # scriptSig
        None, # witness
        None, # nonce
        None, # entropy
        None, # issuance amount
        None, # inflation keys
        None, # issuance amount rangeproof
        None, # inflation keys rangeproof
        None, # pegin witness
        flags)

for vin, script_pubkey in enumerate(script_pubkeys_in):

```

(continues on next page)

(continued from previous page)

```
privkey = wally.bip32_key_get_priv_key(wallet_derived_key)
pubkey = wally.ec_public_key_from_private_key(privkey)

sighash = wally.tx_get_elements_signature_hash(
    output_tx, vin, script_pubkey, None, wally.WALLY_SIGHASH_ALL, 0)

signature = wally.ec_sig_from_bytes(
    pubkey, sighash, wally.EC_FLAG_ECDSA)

scriptsig = wally.scriptsig_p2pkh_from_sig(
    pubkey, signature, wally.WALLY_SIGHASH_ALL)

wally.tx_set_input_script(output_tx, vin, scriptsig)
```

The transaction is now ready to be broadcast, the hex value is easily retrieved by calling `wally_tx_to_hex()`.

```
tx_hex = wally.tx_to_hex(output_tx, wally.WALLY_TX_FLAG_USE_WITNESS)
```

CHAPTER 16

Anti-Exfil Protocol

The following walkthrough demonstrates how to use libwally to implement the ECDSA Anti-Exfil Protocol to prevent a signing device from exfiltrating the secret signing keys through biased signature nonces. For the full details, see [here](#).

The example code here is written in python using the generated python swig wrappers.

16.1 Step 1

The host draws randomness `rho` and computes a commitment to it:

```
host_commitment = wally.ae_host_commit_from_bytes(rho, wally.EC_FLAG_ECDSA)
```

Host sends `host_commitment` to the signer.

16.2 Step 2

The signing device computes the original nonce `R`, i.e. `signer_commitment`:

```
signer_commitment = wally.ae_signer_commit_from_bytes(priv_key, message_hash, host_
    ↪commitment, wally.EC_FLAG_ECDSA)
```

Signing device sends `signer_commitment` to the host.

Warning: If, at any point from this step onward, the hardware device fails, it is okay to restart the protocol using **exactly the same** `rho` and checking that the hardware device proposes **exactly the same** `R`. Otherwise, the hardware device may be selectively aborting and thereby biasing the set of nonces that are used in actual signatures.

It takes many (>100) such aborts before there is a plausible attack, given current knowledge in 2020. However such aborts accumulate even across a total replacement of all relevant devices (but not across replacement of the actual signing keys with new independently random ones).

In case the hardware device cannot be made to sign with the given `rho`, `R` pair, wallet authors should alert the user and present a very scary message implying that if this happens more than even a few times, say 20 or more times EVER, they should change hardware vendors and perhaps sweep their coins.

16.3 Step 3

The host replies with `rho` generated at [Step 1](#).

16.4 Step 4

The signing device signs and provide the signature to the host:

```
signature = wally.ae_sig_from_bytes(priv_key, message_hash, rho, wally.EC_FLAG_ECDSA)
```

16.5 Step 5

The host verifies that the signature's public nonce matches the signer commitment `R` from [Step 2](#) and its original randomness `rho`:

```
wally.ae_verify(pub_key, message_hash, rho, signer_commitment, wally.EC_FLAG_ECDSA, ↵signature)
```
